Paul> In the UK, yes :-)

Isn't this a question of how common the computer is and
of course, if the computer is a popular item on the classic
video games market. My assumption is that it is hard to find
an Atari 800 in Europe. How many were sold in the UK?

The price level in different countries and different parts
of the world is interesting.

The Vectrex system seems to be popular among collectors and
gameplayers everywhere. Although I am an Atari freak, I paid
the equivalent of £200 for a Vectrex base unit with six games
last year, in Sweden.

Cool! I thought I had heard of almost all Atari titles for the
8-bit home computer, but this one is new to me.

I looked it up on the web and found screenshots.

http://xlent.nostalgia.pl/software/games/m/0046.html

Big graphics, a bit like "Sticky Bears Basket Bounce".

Unfortunately atariworld.com has closed and you are currently
redirected to 'Holmes Atari 8bit Games'.

I've been able to locate the (old) html file in google's cache, but
the image of the schematics (megxlscm.gif) is missing (of course).

Does someone have a local copy of the schematics he/she could
upload/email/whatever?

so long & thanx,

Hias

1526. Okay, let me know if this can be optimized any more...

It's relocateable and is meant to be called like :

MYCSET=USR(ADR("blahblahblah"))

What it does is look in 106, subtracts 4, ensures the result is a multiple of 4, stores it back into 106, moves the rom charset into this new value pointed by 106 and returns the new charset location in MYCSET to the Atari Basic programmer.

The programmer is supposed to issue his graphics command and then poke 756,MYCSET/256.

I didn't poke 756 in the ML routine because if he issued the graphics command (which he supposed to after updating location 106) it would reset 756 back to the rom character set value of 224.

It's blazing fast! No comparison to peeking and poking the entire rom charset in basic for next loop. That's for sure. Let me know if there are any optimizations that can be done! I am really interested in knowing if there are any...

>without PBI. I don't think i have ever seen a PBI less version,
>but i live in the UK....

I live in the UK too, my PAL 65XE is also PBI-less.

Don't know for sure where it originated though since I bought it second hand
at a radio rally. However it is definitely a PAL-I model.

> 800s, didn't have one IIRC

That's right, the 400, 800 and 1200XL don't have PBI interfaces.

> Not sure if the one on the XL range is compatable with the XE
>ones....

It is, but it uses a different connector - which would necessitate either two
different versions of the interface or an adapter.

I always thought the XE PBI interface was a joke, how the hell are you
supposed to use a cartridge and a PBI device at the same time? The XL
implementation was far more logical.

>....so for maximum compatability SIO is the way to go.

Absolutely.

Great news for all game lovers !
Konrad Szczesniak, author of L.K.Avalon's "Electra", send me a disk with
a never released game called "3d24".
L.K.Avalon stopped producing games for the Atari XL computers when this
game was finished - so it never saw the daylight... unitil now !

Visit my web-page to download the game :-)
http://mrbacardi.atari.org

Greetings,
- Mr.Bacardi -I

Hi,

To upgrade it's easy when you have the 4 chip version, 2x 4464 chips, add 2 more chips on the 2 places below. Or when you have an 8 chip version, solder 8x 4164 in the right row. Secondly you need to order a PAL chip at Best Electronics about $10 you can put that into the free space on the right side of the rams where you woulkd see 3 jumpers in a empty place where you can put a chip. Remove these jumpers and place the PAL chip there. I just need to look up the number for the PAL chip. Then the system will act like a normal 130XE. But the extra chips can also be replaced by 2x 44256 or 41256 and with 1 extra chip and make the system 320Kb....

I will look for the parts later... but it's easy to upgrade...

TXG/MNX

In reply to Ron Hamilton (oldatarian at atariland dot com), who
scribbled:
-> Hi Mike; ... Where are you?

"Mike K" (steakum47 at hotmail dot com) on Fri, 08 Mar 2002 at
02:26:31 GMT, replied:
->Thank you for the information. Another kind Atari user is actually
->sending me everything I'll need to get started.

But still.... There is some value to answering that question
when we long-in-the-tooth 8-bitters ask it. The newcomer (or old-
timer selling out an entire system, or whatever) may be steered to
other active users in his or her local area -- thereby eliminating
the need for doing things like sending DOS bootup disks by snail-
mail. But other readers can't provide local information if they
don't know where "local" is!

In this case examination of info in the long message header shows
that Mike K is probably located in a city that still has a group of
active Atarians. He's luckier than he realizes. But then, that
depends on where he actually is.... Which brings us back to:

... Ron Hamilton, who scribbled:
-> Hi Mike; ... Where are you?

* ATARI -- Love it or leave it! *

---------- Forwarded message ---------- (excerpted)
Date: Wed, 6 Mar 2002 00:29:36 -0500 (EST)
From: Computerfest's Publicity Staff

The Spring 2002 Computerfest® is almost here. Computerfest® arrives at Dayton's Hara Arena Complex on March 16 & 17, 2002.

LINUX PLAYGROUND DEALS DARA VAN
SPEAKERS OTAP PRINTER REPAIR
OLD TIMER COMPUTER FAIR
DOOR PRIZES (INCLUDING 3 COMPUTER SYSTEMS)

You get ALL this and more for only $8.00 in advance and $10.00 the day of the show. Advanced tickets are available now online, see www.computerfest.com for details, at the Hara Arena Box Office, as well as most Dayton area computer stores. Call the store first for ticket availability.

[Editor's Note: Hara Arena & Convention Center is located on the northwestern side of Dayton. Go west from the Needmore Road exit of I-75 and follow the signs. The Hara Complex is located at the intersection of Shiloh Springs Road and Wolf Road.]

Computerfest® has it all: Hardware, Software, Books, Literature and Supplies. You will see why we are the computer show that you have trusted for over 26 years! This show has several exciting features.

Linux user groups from around the area (under the direction of Don Corbet, "The Linux Guy"), have banded together to offer an extensive array of Linux speakers. A play area allows you to experience Linux as you learn from the experts.

The Dayton Amateur Radio Association (DARA) is sponsoring an exhibit on Ham Radio and computers. The DARA Van, an emergency response communications vehicle equipped with lots of high tech radio and communication equipment is on display.

Clay's Printer Repairs is offering factory authorized service on Hewlett Packard, Lexmark, and OKI printers (both inkjet and laser). Estimates and simple repairs while you wait. More complex repairs can be taken in and shipped back to you.

For those computing 'Old Timers' among us, our Computerfest® Museum Curator, Gary Ganger, will be hosting gatherings throughout the weekend for those who would like to discuss, or just reminisce about some of the systems that pioneered this industry. Come meet old friends and make new ones, while you talk about the good old days.

The Ohio Technology Access Project (OTAP) will test products that you have purchased at the show for a small donation.

You can drop off your ticket stub and have a chance at winning our grand prize, a 2 Gigahertz multimedia computer system. Or you may win one of our hourly door prizes donated by exhibitors at the show! You can also purchase our show T-shirt, Sunscreens, Mugs, Tool Kits and more. Or just come by to talk to friends. It is a place to meet great people!

This year's seminar lineup is the best ever! Some of the topics being presented include Linux, e-Commerce, computer crimes, online investing, networking, web pages, firewalls, and certifications. These seminars will provide a wealth of information and all are FREE with your paid admission. A complete schedule of the weekend's seminars can be found on the Computerfest® web site.

And of course Computerfest® offers deals! With hundreds of booths selling computer products of every kind, you are sure to find the computer product you need at the price you want. We have some of the friendliest vendors in the industry. They listen and they care.

No mention of Computerfest® can be complete without thanks to the handful of staff that works year round making this show run, or the hundreds of dedicated volunteers who work the weekend to support them.

Computerfest® is sponsored by the Dayton Microcomputer Association (DMA®), a nearly 800 member strong non-profit computer user group. All proceeds from the show go back to the community.

Check the our website at www.computerfest.com, for updated information. We look forward to seeing you at Computerfest®

Enjoy COMPUTERFEST®!!!!

For the safety of yourself and others DMA® and Computerfest®
reserves the right to inspect any item, bag, purse, package or
parcel brought on to HARA property.

You can drop the redundant CPY in 330; BNE means branch if not equal to
zero... Saves 2 bytes. You could save a few cycles in the loop doing the
same with X;
set it to 4 and DEX to a BNE with no CPX. No byte count savings as you need
a LDX #4. You would probably sense very little difference in percieved run
time.

:)

Columbus, OH (home of the bally astrocade!)

There also looks to be an active Atari 8bit user group in Columbus as well.
Never attended, but I plan on making the next meeting.
http://www.angelfire.com/oh4/acec/acec.html

If anyone has old Atari advertisements from Magazines or brochures I'd be
interested in some scans of them. I'm putting together a web page devoted
to old computer and especially the Atari 8 bits.

Thanks again,
Mike

The following news has just come in so I'm forwarding it for the 8-bitters on this newsgroup. There's no Atari 8-bit stuff at these shows anymore, but for anybody within 500 miles of Dayton, Ohio, Computerfest is still a great show well worth going to!

(Well, actually, it's worth going to if you're 5000 miles from Dayton, but that's a pretty long one-day drive! You know what I mean?!)

---------- Forwarded message ---------- (excerpted)
Date: Wed, 6 Mar 2002 00:29:36 -0500 (EST)
From: Computerfest's Publicity Staff

The Spring 2002 Computerfest® is almost here. Computerfest® arrives at Dayton's Hara Arena Complex on March 16 & 17, 2002.

LINUX PLAYGROUND DEALS DARA VAN
SPEAKERS OTAP PRINTER REPAIR
OLD TIMER COMPUTER FAIR
DOOR PRIZES (INCLUDING 3 COMPUTER SYSTEMS)

You get ALL this and more for only $8.00 in advance and $10.00 the day of the show. Advanced tickets are available now online, see www.computerfest.com for details, at the Hara Arena Box Office, as well as most Dayton area computer stores. Call the store first for ticket availability.

[Editor's Note: Hara Arena & Convention Center is located on the northwestern side of Dayton. Go west from the Needmore Road exit of I-75 and follow the signs. The Hara Complex is located at the inter-section of Shiloh Springs Road and Wolf Road.]

Computerfest® has it all: Hardware, Software, Books, Literature and Supplies. You will see why we are the computer show that you

have trusted for over 26 years! This show has several exciting features.

Linux user groups from around the area (under the direction of Don Corbet, "The Linux Guy"), have banded together to offer an extensive array of Linux speakers. A play area allows you to experience Linux as you learn from the experts.

The Dayton Amateur Radio Association (DARA) is sponsoring an exhibit on Ham Radio and computers. The DARA Van, an emergency response communications vehicle equipped with lots of high tech radio and communication equipment is on display.

Clay's Printer Repairs is offering factory authorized service on Hewlett Packard, Lexmark, and OKI printers (both inkjet and laser). Estimates and simple repairs while you wait. More complex repairs can be taken in and shipped back to you.

For those computing 'Old Timers' among us, our Computerfest® Museum Curator, Gary Ganger, will be hosting gatherings throughout the weekend for those who would like to discuss, or just reminisce about some of the systems that pioneered this industry. Come meet old friends and make new ones, while you talk about the good old days.

The Ohio Technology Access Project (OTAP) will test products that you have purchased at the show for a small donation.

You can drop off your ticket stub and have a chance at winning our grand prize, a 2 Gigahertz multimedia computer system. Or you may win one of our hourly door prizes donated by exhibitors at the show! You can also purchase our show T-shirt, Sunscreens, Mugs, Tool Kits and more. Or just come by to talk to friends. It is a place to meet great people!

This year's seminar lineup is the best ever! Some of the topics being presented include Linux, e-Commerce, computer crimes, online investing, networking, web pages, firewalls, and certifications. These seminars will provide a wealth of information and all are FREE with your paid admission. A complete schedule of the weekend's seminars can be found on the Computerfest® web site.

And of course Computerfest® offers deals! With hundreds of booths selling computer products of every kind, you are sure to find the computer product you need at the price you want. We have some of the friendliest vendors in the industry. They listen and they care.

No mention of Computerfest® can be complete without thanks to the handful of staff that works year round making this show run, or the hundreds of dedicated volunteers who work the weekend to support them.

Computerfest® is sponsored by the Dayton Microcomputer Association (DMA®), a nearly 800 member strong non-profit computer user group. All proceeds from the show go back to the community.

Check the our website at www.computerfest.com, for updated information. We look forward to seeing you at Computerfest®

Enjoy COMPUTERFEST®!!!!

For the safety of yourself and others DMA® and Computerfest® reserves the right to inspect any item, bag, purse, package or parcel brought on to HARA property.

1543. D3: Access w/ AtariWinPlus3.0

I get a 160 error when trying to access D3: from AtariWinPlus3.0.
Same result with both DOS XL 2.2 and AtariDos 2.5. Can anyone access
above D2: using this emulator (think I have latest 3.0 beta).
Thanks.

ron

1546. FA (Ebay): Atari Hardware

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-10 06:40:22 UTC
From: bobbyshaw@aol.com
Message-ID: <20020310014022.11033.00001112@mb-cu.aol.com>
Source record: 30617

This is the last batch of items I have for sale. Everything else is gone
except for the hardware, and the few floppies that didn't sell last week.
Everything is up on Ebay starting at $0.01 so I'm sure to sell it. Here is the
link to my auctions:

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?MfcISAPICommand=ViewListedItems&
userid=bobbyshaw@aol.com

And here's a list of what I have up right now:

Seikosha Axiom AT-100 Printer for Atari
Indus GT 5.25 disk drive for Atari
Atari 1050 disk drive
Atari 410 Program Recorder (non-working)
Atari 850 Interface Module
Atari 130XE computer
B Key 400 keyboard upgrade for Atari 400
Atari 400 computer
Atari 800 computer (bad spacebar)
Atari Joystick
Atari Paddle Contollers
Lot of 5 partial/non-working Atari Joysticks
2 non-working Atari Power supplies
Wico Command Control Joystick
Wico Boss Precision Engineered Joystick
Suncom TAC-2 joystick
6 foot Atari I/O Cable
Flight Simulator II-ATARI 8-bit XE cart+disks
Computer Football Strategy - Atari 8-bit disk
Family Cash Flow - Atari 400/800/XL/XE floppy
My First Alphabet - Atari 400/800/XL/XE disk
Shootout at the OK Galaxy - Atari 8-bit disk
Original Infocom Suspended Map
Original Microprose Silent Service Manual
Atari Juggles House manual

Thanks for looking!
Robert Shaw

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Also, there is a little "character" control panel that
displays the entire 256 character set available to you.
When this is open, you can double-click a character and
it will be inserted into your document... Just another
alternative.

I have no problems while accessing D3: with Atari800Win PLus 3.0.
Didi you have this problem with Atari800Win PLus 2.7b? You must know that
Version 3.0 is only a Beta-Version (but accessing a disk should no problem).

But the problem can be another: is your DOS XL 2.2 or AtariDOS 2.5 prepared
to access more than two drives? AtariDOS for default accesses only D1: and
D2:. You have to use a config-tool (is on the original, complete
ATARI-DOS-Disk) to make ATARI-DOS access D3: (and D4:).

Try to access D3:-D7: with MyDOS. MyDOS for default can access all drives
(D1:-D7:, D8: is RAMDISK for default).

It isn't the emulator's problem, it's the Atari DOS configuration.
There is a memory location you need to POKE to use drive numbers higher than
2 in Atari DOS.
In Atari Basic:
POKE 1802,15
then go to DOS and select H. Write DOS Files.
(the value 15 lets you use drives D1-D4.)

Hi, Ron.
PEEK 1802. It is probably 3.
Poke 1802,15 and you set up for 4 drives, the maximum I think
for DOS 2.5.
You have to do the POKE, then goto DOS, then write DOS files,
then reboot.
This should work on emulator.
Or use MyDOS image, I think it defaults to a full 8 drives.

I would just like to get some feedback on an idea that I have. I'm considering organising a retro computer show in the North East of England. I want to try and get lots of retro computer owners together in one place for a day, to being along their systems. I only want retro game systems and so anything up to say 1994 would qualify as "retro" e.g

Sega Mega CD
PC engine
Amstrad CPC
Spectrums
C64
Neo-Geo

As well as everyone being able to show off their colections, I would be organsing debates, competitions, etc. Costs would be kept to a minimum as all I'd have to cover is the hiring of a venue.

Any feedback or comments would be most welcomed.

regards

Dave

I have a bunch of 8-bit Atari stuff, that, one could have if they want to come and get it. I'm in Perrysburg, Ohio which is near Toledo. So anyone in in NW Ohio or SE Michigan would be within an hours drive or so. Most of NE Indiana is within couple of hours and Cleveland is only a couple also. I have:

Two 800XLs, both with 256K RAM, one with RAMBO XL and the other with OMNIMON XL and RAMrod XL, both work fine.
Two power supplies.
An Indus GT with power supply, works fine.
A carton of 10 boxes of 10 each DS/DD 5 1/4" diskettes.
Cartridge version of MAC/65 with book.
C/65 diskette with book.
Basic XL book for cartridge but alas no cartridge.
The remains of an 800XL after the keyboard was removed to put in one of the working XLs.
An SIO2PC cable.

I'll keep this stuff for a while and see if anyone is willing to come and get it. I was back into this for a while, but I just don't have the time for it now and would rather see it put to use by someone who really will use it. I'm not interested in shipping any of this, and I don't have space to store
it for long and it will end up in a landfill if no-one wants it for free..

Any takers? Just reply and I'll tell you how to get here. Unfortunately it would have to be an evening or weekend.

Thanks,
John

: supposed to use a cartridge and a PBI device at the same time?

No problem. There are some adapters out there (like those for the MIO) that
will convert the 2 XE bus' to the XL bus and have a connector on top (or two)
in where you can put the cartridge.

Hardware like the BlackBox has such a connector built-in.

1575. Atari LOGO

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-11 00:20:01 UTC
From: Eric Scharff <e.d.s_2@yahoo.com>
Message-ID: <3c8bf831@cs.colorado.edu>
Source record: 30646

I am trying to dig up some of the 8-bit LOGO implementations that were so common in our elementary schools throughout the 1980s. I'm trying to do a comparison of what is out there. Unfortunately, I've not had much luck.

Does anyone know where one could find the Atari implementation of the LOGO programming language? I own an Atari 800 and would be willing to purchase something, but I would prefer something that could be used in an emulator. So if there isn't an emulator-friendly version out there, instructions on how to convert something for use with an emulator would be greatly appreciated.

Hoping someone out there is keeping the LOGO dream alive. :)

-Eric

Several ways to unify a file into a single load block.

We already mentioned DOS to load and then resave if tthe file loads into available
memory.

You could also do it yourself in Basic from 1 file to another. Just OPEN #1,4,0,"D:TEST.OBJ" to read it in and OPEN #2,8,0,"D:UNIFIED.OBJ" for writing out the streamlined version. With a series of FOR .. NEXT with GET #1 and PUT #2 and some IF .. THEN testing you could eliminate the intermediate vectors and consolidate your file. Need to read it prior in order to know the ending vector or else go back in update mode to finalize bytes 5 & 6. Might even renove the FF FF and *all* vectors for relocatable code and make it a plain data file; you could
then skip the 1st 6 GETs at string load time.

There was also a utility that came with Oasis or Express Pro or some BBS since their modules needed to be single block loads.

>correct that.

Well, I just read my 1.0 specifications and it clearly states that
DiskComm can handle disks of up to 9999 sectors. If they are double
density, that is more than 2 meg. I also mentioned that it would
support the HDI floppy drive, which is 1.44 Meg. I did mention that
those three formats are the most common, but you can even DiskComm a
hard drive partition as long as it is not larger than 9999 sectors.
Anyway, I think converting to ATR is easy, since you just keep
extracting data until you run into the end of archive indicator,
regardless of the number of sectors, however, to extend the atr image
to the proper size, you need to know the actual end of the disk.
My simple dcm to atr converter is on my home page, it includes the
'C'-source code, so you can fix it yourself, but I think it will work
on large images. It is named dcm2atr. Take a look at
http://home.planet.nl/~ernest

Keep those XL's/XE's humming.
Ernest.

I don't know who still has the cartridge (you can try Best Electronics or B&C Computervisions,) but the Atari version was superior to the others in several ways. Four turtles, all doing different things in different colors, could occupy the screen at one time, for one thing. I haven't seen LOGO for emulation, or I would have grabbed it, but the disk-based Lisp is available as an .atr.

So, add me to the list of people who'd like to see Atari LOGO as an atr. ...

Sorry I couldn't help.

Hi John,

I'm very interested. I'm just getting in the Atari 8 bit scene. I have a nice collection of old Apple computers so far and I want to start my Atari collection.

Do you know if you have any kids software? My kids love these classic computers!

Thanks,
Mike

Hi Ron,

I'm not picky. Anything would be appreciated. I just want to gather as much content as possible for the Atari. I've spent a couple hours each night just playing around with my newly acquired Atari computers. I figure anything anyone has would be great. I would like to post it on my web site and share it with the rest of the world.

Thanks,
Mike

(Please direct replies to comp.sys.sinclair or my e-mail address.)

I have compiled the first searchable database of Boulder Dash games and clones from the 1980s to the present.

I'd appreciate any help in extending the database to cover games and clones on all platforms. The only ones that I believe to be anywhere near complete are Spectrum and Amiga, but even there I expect I've missed a few.

The site is located at http://boulder.cl4.org/

I was told that Atari's Logo and Apples Logo were identical except for the computer they ran on. So I went out and got an Apple Logo book (couldn't find an atari version) and tried a few commands. None of it worked. Maybe if someone has the original manual they could scan it for the web.

Mike.
Get those computers and the SIO2PC cable and you have
a world of stuff kids like avaiable to you.
There are kid specific programs, like 'Ducks Ahoy' and
'Grandma's House' and 'Dr. Seuss Mix 'em Up'. But they'd
probably like the old games like 'PacMan', 'Galaxian', 'Centepede',
'Keystone Kapers' and lots of others.

They may be able to give you Ideas of what works/didn't work.

Only mentioning the 'Arch rival' machine in this group was a bit of a fo-par
;0)

"Ramjam" <ramjam55@btinternet.com> wrote in message
news:a6g297$dh2$1@paris.btinternet.com...
I would just like to get some feedback on an idea that I have. I'm
considering organising a retro computer show in the North East of England.
I want to try and get lots of retro computer owners together in one place
for a day, to being along their systems. I only want retro game systems and
so anything up to say 1994 would qualify as "retro" e.g

Sega Mega CD
PC engine
Amstrad CPC
Spectrums
C64
Neo-Geo

As well as everyone being able to show off their colections, I would be
organsing debates, competitions, etc. Costs would be kept to a minimum as
all I'd have to cover is the hiring of a venue.

Any feedback or comments would be most welcomed.

regards

Dave

When we say 'equal to zero' we mean that the zero flag in the processor
status bits is set. This flag is set when zero is encountered in referenced
memory or a register and also when two compared values have zero difference.

I looked up some on UK money.
You went decimal in 1971. But remember my UK money
experience is from Dickens and 'A Christmas Carol' and maybe
Shakespear.
Two bob, six shillings, three farthings and an apple in a patridge tree.
I still don't understand it, but it should be easy. A pence is
100 of a £ now, used to be 240 pence to a £ (I think). I guess a shilling
is still 20 for a £, or like our 'nickle' 5cent peice.
If you ever come to Cleveland, Ohio, I'd give you a working 800.
It probably wouldn't be too good for you tho, because it is NTSC,
and I don't think you could easily put a PAL Antic in it and it uses
a 120v 60 cycle pwr supply, instead of 220v 50hz, still 9v ac at
the computer end. I think there's more than one type of PAL, even.
It's great that we can still like the Atari 8-bit stuff, all over the
globe.
£102.99 is clear enough, a lot.
The biggest I ever saw here on csa8 was when Jim King sold
a complete development setup. An 800, ACTION!, M65,
BXE, BXL, 810, pwr supplies and cables and books for $800 if I recall. That
was about what the stuff sold for in 1980. A lot has to do with
the fact that he packaged the stuff and described it really well.

Hey,

Agent USA is one excellent game. Several years after pretty much mastering it, I discovered it was actually written as an "educational" title to teach states and capitals. So not only have I played a cool game, but I know what the capital of Nebraska is, too!

The tune is cool. Short yet sweet. Why don't you play the game on an emulator, and extract the sound to a wav? Atari800Win has that option..

If you can't do it I can do it for you, just ask. (oh, and if you find a medical facility that can help, please inform me as well :)

That reminds me ... I found a 14 year old cassette with several Atari sounds on it, themes from games (but no Agent USA among them) and demos and some titles from music programs. The tape (a really cheap one, recorded on a simple radio/cassette combination) had after this long time the interesting effect of sounding like stereo?!?

I knew there was a rare 65XEM with two soundchips, and some people enhanced their XL with a second POKEY, but mine was a standard 800XL, so it had only mono (only very few pieces of software would have used the second audio chip).

Because the 6502 CPU can only address 64KB. But you need the BIOS ROM, the memory mapped I/O range and perhaps the BASIC ROM, so can't use the full RAM without tricks. If you need the additional RAM, make sure to disable interrupts like VBI and don't call any system routines. Further, you need a buffer in a lower memory area to exchange data with the Behind-BIOS-RAM (remember, you can't load or store it directly). Some clever implementations like in TurboBASIC reimplement the call gate table like in the ROM, either by handling the system calls directly or by jumping to a routine which reenables the BIOS ROM, calls the original code there and switches the MMU afterwards again to RAM mode.

For the machines with more than 64KB RAM, there was a different mechanism, but you still need a double buffer to copy data between the different 16KB pages.

Because the additional 16K in the XL/XE models can only be accessed through
methods which are "trickier" than what BASIC uses, since they share the same
addresses ROM and I/O space do. (and actually, only an additional 14K can be
accessed, since, AFAIK, no trick whatsoever would allow you access to the 2K
in parallel to the I/O space)

I was looking through some old Atari papers looking for some ads for a guy from another thread. I came across a mail order catalog from a company called UHC dated 10/18/1982.

Here's their computer prices:
Atari 400 - list $349, sale $289
Atari 800 - list $688, sale $549

I'll be happy to scan the whole thing and put it out there for all to see the old prices. Pretty interesting.

1621. The ultimate Player move ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-12 12:53:07 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <8Pmj8.48556$Nn6.2678262@e3500-atl2.usenetserver.com>
Source record: 30742

Before I actually begin implementing this I'd like your feedback.

I'm going to create a relocateable ML routine that will move all 4 players
according to how you set it up.

The ML routine will be called like the following :

```
MOVEPM$="relocateable_ML_code"
MOVEPM = ADR(MOVEPM$)
X=USR(MOVEPM,MOVEPM)
```

I am passing the address of the ML routine because all the variables that
this routine uses will be place at the beginning of the MOVEPM$ string. So
this routine will start something like :

```
PLA (number of variables passed to USR function=1)
BNE START

PO_VARS_OFFSET:
.BYTE DIRECTION (contains Joystick#1-4 to read or a compatible joystick
forced direction, or zero = skip processing for this player)
.BYTE DY (or speed in Y direction, or zero disables vertical movement)
.BYTE Y
.BYTE YMIN
.BYTE YMAX
.BYTE IMAGELSB
.BYTE IMAGEMSB
.BYTE DX (or speed in X direction, or zero disables horizontal movement)
.BYTE X
.BYTE XMIN
.BYTE XMAX

P1_VARS_OFFSET:
DUPLICATE 11 BYTES AS P0
P2_VARS_OFFSET:
DUPLICATE 11 BYTES AS P0
P3_VARS_OFFSET:
DUPLICATE 11 BYTES AS P0

START :
PLA (MSB of MOVEPM)
STA 204
PLA (LSB of MOVEPM)
STA 203
LDY #3 -- OFFSET for beginning of1st Player's VARS from MOVEPM
```

```
CHECK_PLAYER:
LDA (203),Y -- Is this player enabled?
BNE PROCESS_THIS_PLAYER

NEXT_PLAYER:
TYA
CLC
ADC #11
CMP #58
BEQ DONE
TAY
BNE CHECK_PLAYER

DONE:
RTS

PROCESS_THIS_PLAYER:
TYA
PHA (Save value of Y)
LDA (203),Y (Read joystick or forced direction?)
CMP #4

...

PLA
TAY (restore Y)
BNE NEXT_PLAYER (might be unreachable with a single branch)
```

Now the cool thing about this routine is I've tried to arrange the variables in the order that they would be needed to be read, so to get to the next variable you simply INY...

I can make all the missiles into a player 5 also, but for now I'm just going to do the standard 4 players.

When this routine is done, hopefully it would be able to be implemented as a VBI without any problems.

So what do you think? Does this sound ok? I don't know yet how viable it would be to use Y as the index into the variables. I don't remember 6502 fully, but please tell me I can do indirect addressing offset by X as well?

Let me know...thanks.

Are future generations lost? They will miss out on being able to speak machine language with the Atari. We witnessed the birth of personal computers. We know the humble beginnings. We know the limitations of the earliest computers and how much fun they can be to work with. It was because of the Atari I got into computers, if I had grown up in todays generation I would defenitely have only been a computer user rather than a programmer. On the Atari you can play God. On the PC, you're just a "user".

Programming 6502 ML code is better than sex.

1622. Re: The ultimate Player move ML routine

Source record: 30743

I performed a little optimization :

> START :
> PLA (MSB of MOVEPM) -- Alternatively, the user can Poke 203&204 with
MOVEPM only once provided that 203 and 204 are not overwritten by any other
routines. Not sure if this is a good idea...

> STA 204
> PLA (LSB of MOVEPM)
> STA 203
> LDY #3 -- OFFSET for beginning of1st Player's VARS from MOVEPM
>
> CHECK_PLAYER:
> LDA (203),Y -- Is this player enabled?
> BNE PROCESS_THIS_PLAYER
>
> NEXT_PLAYER:
> TYA

I'm moving the NEXT_PLAYER label right here instead of above :
> CLC
> ADC #11
> CMP #58
> BEQ DONE
> TAY
> BNE CHECK_PLAYER
>
> DONE:
> RTS
>
> PROCESS_THIS_PLAYER:
> TAX (Save jstick#1-4 to read, or forced direction)
> TYA
> PHA (Save value of Y)
> CPX #4 (Read jstick#1-4 or forced direction?)
> ...
>
> FINISHED_PROCESSING_PLAYER:
> PLA (restore Y)
> BNE NEXT_PLAYER (might be unreachable with a single branch)

Hi,

> No problem. There are some adapters out there (like those for
>the MIO) that will convert the 2 XE bus' to the XL bus....

But it is a problem, because manufacturers then have to provide an adapter (or build one in) or expect the consumer to buy a separate one.

Either way, it's extra cost for the consumer and/or more hassle for the manufacturer (both of whom then won't bother).

Once you establish a standard like PBI you have to stick with it - or at least stay physically compatible. Otherwise you kill the standard, like Atari did with this half-assed move. :-(

TTFN - Pete.

Howdy *.*!

For a little asm intro I need some music playing routines. How could I do this? I'm no musican and want's to take a .sap file, remove the sap header and include it in my asm project.

But without a functional msx - handler the best intro is a shame :-(...

What's with cmc, md8 and tmc playing routines? Are they availble for free?

As my plans for the future, I still have the dream to build a SAP-player on real atari. so ton's of the musics in asma collection could be played without doing it with a toy of pc :-)

bye sez

1628. Re: The ultimate Player move ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-12 15:49:26 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <ropj8.50314$Nn6.2722279@e3500-atl2.usenetserver.com>
Source record: 30548

Now I'm brainstorming.

Instead of having the players variables placed at the beginning of the routine and instead of having a loop to process each player, here's the next level of optimization :

```
PMOVE$="relocateable_object_code"
PMOVE=ADR(PMOVE$)
X=USR(PMOVE) with no variables passed!
```

Set up these arrays for the Atari basic user once the object code in PMOVE$ is finalized:

```
DIM DIR(4):X(4):Y(4):DX(4):DY(4):XMIN(4):XMAX(4):YMIN(4):YMAX(4):IMAGE(4)
DIR(1)=PMOVE+2
.. and so on for all the array variables above
```

For simplicity, Players are numbered 1 to 4, and joystick ports are numbered 1 to 4

Want to disable a player? Just POKE DIR(player#),0 to disable it
Want a jstick controlled player? Just POKE DIR(player#),joystick port#
Want to force a jstick direction for a player? Just POKE DIR(player#),jstick-compatible direction value

This is what the new ML routine in PMOVE$ looks like :

```
PLA (required, pull off zero variable count from the stack pushed by USR
function)
P1: (The code for P1 will pretty much be duplicated in P2, P3 and P4)
```

This is where it gets cool!

```
LDA #P0_DIR (the value for P0_DIR was poked beforehand into ADR(PMOVE$)+2,
remember?)
BEQ P2 (in any case, the compiled object code will have all the P#DIRs set
to zero for safety)
CMP #4 (if greater than 4 then it's a forced direction)
etc...

P2:
P3:
P4:
...
RTS
```

Even greater optimizations would include having the Atari basic user poke the LSB of the jstick port# into a predefined offset, specified in the array DIM JPORT(4). This would simplify the ML routine so all joystick port reads

would be coded as LDA 632, and the LSB would be changed to the desired
port# by pokeing JPORT(player#), desired jstick port LSB value ... as a
matter of fact the code can be initialized so that each player# is
controlled by the corresponding joystick port#.

I told you guys this was better than sex!

1630. Re: The ultimate Player move ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-12 16:43:05 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <Kaqj8.50828$Nn6.2732117@e3500-atl2.usenetserver.com>

Hey guys correct me if I'm wrong, but doing it this way, there would be zero indirect addressing instructions since even the copying of the player's image into it's location could be coded as

```
LDA $0000,X
STA $0000,Y
```

with the $0000 in the LDA being replaced with 2 pokes of the player image's LSB&MSB which by the way, could also be stored conveniently in a string. X could be loaded with the image length, another offset defined array DIM PLENGTH(4), coded as LDX #$FF and the $FF changed by pokeing PLENGTH(player#),length

and the $0000 in the STA being replaced with 2 pokes of the player's beginning location in PM memory. The Y could be loaded with the new Y coordinate of the player after jstick/direction reads and DY calculations+image length, and can be decremented with each DEX of the image's length in X. After the DEX, BNE continue_copying_image.

I guess player animation can by performed by just poking the
image(player#),lsb
and image(player#)+1,msb.

With no indirect addressing this routine should be super fast!

I'll have to make that $FFFF in both cases or the compiler would generate
zero page addressing mode and send me to debugging hell!

1632. Re: The ultimate Player move ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-12 17:25:04 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <5Oqj8.51198$Nn6.2744379@e3500-atl2.usenetserver.com>
Source record: 30552

Slight problem encountered as I just started on this ...

X and Y values aren't constants like the others...

I will let the Atari basic user determine where the X and Y values for each player are stored in memory by pokeing X(player#),lsb_of_x# and X(player#)+1,msb_of_x#

He can use page 6 or even another basic string XY$ of length 8, an x and y for each player with only one byte needed each. Then he can DIM PX(4), PY(4):FOR I=1 to 4: PX(I)=ADR(XY$)+I-1:PY(I)=ADR(XY$)+I+3:NEXT I

Then :

FOR I=1 to 4:POKE X(I)+1,PX(I)/256:POKE X(I),PX(I)-256*PEEK(X(I)+1):NEXT I

I think I'll just set it up this way automatically, then if he want's to know the current X-coord of a player# all he has to do is PEEK(X(player#)) same for Y-coord. I will keep the fact that the X and Y coords are stored in a basic string XY$ completely hidden from him. All he needs to know is to set X-coord just poke X(player#),x-value and poke Y(player#),y-value or do PEEKs to read it. Now this is just awesome!

If you're interested in the original manual (in German), I have it.
But I get to keep the folder it came with... ;-)
It was from a friend who had an ST, don't remember why he didn't
need it anymore when he gave it to me... Sorry, no disks, I think
he formatted them.

: >the MIO) that will convert the 2 XE bus' to the XL bus....

Pete wrote

: But it is a problem, because manufacturers then have to provide an adapter
(or
: build one in) or expect the consumer to buy a separate one.

Yes, but I think 2 different styled PBI busses is better then no PBI at all
(as on the 1200XL and lots of 65XE's)

: Either way, it's extra cost for the consumer and/or more hassle for the
: manufacturer (both of whom then won't bother).

True. (hmm, "micro-$oft" is crossing my mind right now, don't know why
:-))
But when looking at the Black-Box on an Atari XE, you'll have the advantage
you can plug in a cartridge vertically in stead of wrestling with it to get it
in the back of it :-)

: Once you establish a standard like PBI you have to stick with it - or at
least
: stay physically compatible.

I agree it would be easier when all Atari's had the same styled PBI bus. Just
wanted to say the problem is not that big.

Wrinkle:

Atari Basic stores array data entries as 6 byte floating point
representations of the numbers.

And, assuming the ADR() function works with arrays, you would:
POKE ADR(DIR(player#)),0 and change the mantissa
or (implied LET) DIR(player#)=0 to alter the FP value.

Both were coded by the same guy. I've reverse engineered the token format of GFA-Basic v3.x, I found a copy of v2.x, now all I need is v1.0 to complete my set. They all have different token formats from what I've read.

1646. A day well spent on Atari 800

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-13 02:49:49 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3c8ebe26$0$1409$1dc6e903@news.corecomm.net>
Source record: 30567

I played with my 800s today.
They work fine. I still think SpDOS X is not reliable with
disk reads and writes, at least the 4.2 or whatever I had.
SpDOS X is the only way (other than 1.1) to use SpDOS with
an 800.
I got out my original disk drive, a RANA, and a second RANA
I bought. Both drives did pretty good, especially with MyDOS.
A8 drives, in my experience, are getting sorta cranky. I have
two Indus, one practically doesn't work, the other is fair.
The best drive I have is a US dblr 1050.
My original RANA from 1984 I found has/had a broken dip
switch block, all the pins from one side of the block broke off
at the mother board.
I've taken the drive apart and removed the switch block and
think I've got it cleaned up to put a new block in, if I can find one.
At this time I'm hoping the drive still works when I'm done.
The drive works fine as D1, because all switches are in the 'off'.
Paul Irving got me wanting to play with my 800s, talking about them
in another thread.

You do not need any special software; DOS should be sufficient, and you can
boot it from the cable.

Use your APE or SIO2PC software to make a large .ATR image and copy all of
your text files to it. Next, get Ken Sider's AtrUtil from:
http://home.columbus.rr.com/ksiders/atari.htm
and you can extract the files and translate them to standard ascii all in
one step. That is it; you are able to access them in any editor.

Okay that looks pretty sweet. It also jarred my memory a little and I dug out the remnants of an ad from the Sears catalog. Didn't we all clip these and hang them on the fridge? I believe it's from 1982, I could be wrong and I'm pretty sure that it's from the same year that I got my first. I remember now the computer was about $600 with 48K RAM and the educator package with BASIC, tape drive (program recorder) and states and capitals was about $200 and the entertainer would've been about $100 with tax put me right about $1000.00
Still pretty cheap for a computer back then.
Here's a link to the scan of the page I found (what's left of it)-

1652. Re: The ultimate Player move ML routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-13 06:43:15 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <huCj8.60156$Nn6.2981391@e3500-atl2.usenetserver.com>
Source record: 30573

Hi Ron,

The only thing I'm storing in arrays are the MEMORY ADDRESSES of the various constants in my ML routine which are going to be used as variables.

For instance :

```
START : PLA
DIR1 : LDA #$FF
...
...
...
BEQ DIR2
```

In my basic program DIR(1) = ADR(ML$)+2

So if the Atari basic programmer wants to disable processing for player 1, he just does :

POKE DIR(1),0 he will be changing the code in ML$ but only the constants
...

It's like a realtime compile of the ML code all over again....

To make it look prettier, I just defined constants P1=1:P2=2:P3=3:P4=4 so to change the setup for a player he just does POKE DX(P1),value POKE DY(P1),value POKE XMIN(P1),value etc.

DX(P1) will be set = ADR(ML$)+the offset where the constant #DX value is used in the ML code for player 1 ...

So I'm not POKEING the address of the arrays ... not at all

I'm using the Arrays to store the offsets of the constants used in ML$ for each player, that's why I'm not having a loop to process each player, but in fact just straight code duplicated pretty much 4 times, that gives the Atari basic user control over each player individually by modifying the constants compiled into the ML routine which really are the various Player variables....

It's pretty tricky... and I've got to store all the offsets of these variables into the arrays so the basic user can just POKE LENGTH(P1),player1's length etc. In the ML code that reads like LDX #$FF , the #$FF will be replaced by whatever the programmer POKE's into that offset from the ML code. remember LENGTH(P1) = ADR(ML$)+some offset that I predefine once my ML code is finalized.

So far I've got movement along X-direction working perfectly, and everything
is absolute, mostly immediate mode addressing, I'm proud to report I'm not
using ANY indirect addressing in my ML routine!

Source record: 30577

I did this mod when it was first published in AC, and was a little disappointed with the results. It was a little better, but only marginally. At that time I was using the composite video output with a composite monitor. Later, I compared the output using a JAM!! and CRT monitor, and still thought it was only slightly better than a "stock" XE. Recently, I put the SV XE back into service with a flat panel display (with JAM!!) -- WOW! Could not believe the difference. I don't know why the difference is so great (at least to my eyes), but text is so sharp and clear, it is absolutely amazing. As a side note, this is the first application where I think that the results are better than using a stock 800 -- still the standard (IMO).

I haven't done any Super Video upgrades.
My opinion is the 130XE has the best video stock of
all A8s. I can see why you don't think there is much improvement
with it. My 800s probably have the worst display, I'd say.
You feel 800s are the best, I have two 800s and a third just
the boards, so I don't think (... editing)...
it is just a fluke. I asked Ben Poehland if he was going to do a
800 SV and he said he was done with SV upgrades. His favorite
A8 was a souped up (like 1 meg or something) 600 XL.
My 800XLs are in the middle and I'm sure a SV upgrade for them would be
noticable.
Your flat screen and JAM are I guess the ultimate with a 130XE SV.
I guess JAM allows composite input to a SVGA monitor.

Oh, Shoot.
I left out the 1200xl, which has the best colors I think.
I've done one particular Compy Shop demo that the colors
are definitely more robust than any other A8 I try it on.
The clarity of the 1200xl is good, but not as good as the stock
130XE, I'd say.

TopDos is of the MyDos type and has both a native mode (without file numbers in the links) and a compatible 2.0/2.5 mode. Native mode is able to alphabetize directories on the disk as files are not associated with a particular directory entry and links are not a concern.

1663. [HELP] 8bit terminal prg in C?

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-13 20:55:50 UTC
From: Chris Martin <cmartin_at_ti_dot_com@a.a>
Message-ID: <3C8FBCD6.754F4844@a.a>
Source record: 30584

Hi all,

I am currently translating Tom Hunt's iterm.bas BASIC program
to C. This program is a simple ATASCII terminal for use
with the Atari800WinPlus3.0 emulator.

I want to learn more about how the R: handler works and
program a few utils and games in C using it. I have coded
what I think is correct C, but the terminal prg hangs the Atari
after receiving a few lines.

Anyway, if anyone knows how to program C or knows how to
program the R: device, please take a look at my C code and
tell me what I am doing wrong (maybe something with the IOCB).

Here is my C program:
http://jybolac.virtualave.net/atari/xterm.c

Here is the assembly:
http://jybolac.virtualave.net/atari/xterm.s

Here is the original BASIC:
http://cth.dtdns.net/Emulator/TerminalClient.html
http://cth.dtdns.net/Emulator/CTH_Emulator.html

Thanks,
Chris
http://jybolac.virtualave.net

1664. Dead 800 tale of woe-- and chance to get my old stuff

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-13 21:24:22 UTC
From: Brian Siano <bsiano@bellatlantic.net>
Message-ID: <3C8FC384.9020900@bellatlantic.net>
Source record: 30585

For some time now, I've wanted to transfer a number of my old Atariwriter files to my PC. I finally got ahold of an SIO2PC cable, and this afternoon, I pulled my old 800 and its parts out of storage to give it a try.

The poor thing can't even get into Memo Pad mode. I guess sitting in storage for nearly twenty years'll do that do ya.

So I've got a nice assembly of old Atari hardware that I ought to just get _rid_ of, but maybe I can still salvage something. Is there anyone near Philadelphia who'd be willing to transfer a small pile of disk contents to PC disks, in exchange for

1 Atari 800 computer (dead, but possibly repairable)
1 Atari 810 disk drive
1 Atari 1050 disk drive
1 Atari 850 interface
2 Atari joysticks
1 Koalapad graphics tablet

Cartridges: Pitfall II, Eastern Front 1941, Basic Computing Language (2), Star Trek Simulator,
Centipede, AstroChase, Jumo Jet Pilot, Protector II, Choplifter, Star Raider

Books: Your Atari Computer, Paperclip instruction manual with disk, Machine Language For Beginners,

1 Commodore 64 monitor, model 1701 still working in TERRIFIC order

Assorted peripheral cables, including 2 Atari-to-Monitor cables

Software, in various conditions: Cutthroats, 810/1050 Master Diskette, 1030 Express, Chessmaster 2000, Music Construction Set, Seven Cities of Gold (these last three with original cardboard pack). Plus, whatever's on the disks I give you.

Possible other pieces of equipment that might turn up when I clean my house.

But there's a catch. You have to be willing to come and get this stuff from me here in Philadelphia, and you have to agree to go through the disks I give you and transfer any recoverable text files to me in a PC format somehow. (Now you know why I'm not doing this on Ebay.) Send me email to work this out. In the meantime, I'll pack it up in a box.

(Reply to myself ??? :))
I got it. I couldn't find a dip switch block that would fit the original
holes. I got a right angle 'header' that's just 8 pins down and
a right angle and 8 pins out. Now I can change the settings with
those little black jumper mathingies. Not as convenient as a
dip switch block, but definitely will last forever/not break like
the original.
I'm not sure which is the latest BeweDOS. Checking that out from
spudster bewedos130.zip and bwdsup2.zip and the bewedosdoc.zip.
I think the one I had was 1.10.
My RANAs are hummy. As someone says 'Keep those Ataris hummy.)

(Ron's 800s better composite than XLs).
Ok, maybe my 800s are different. We're talking here about
display differences that are kinda subjective.
I do remember that the word was the 1200xl with Super Video
has/had the best display of all.
Russ

1667. Making your unrelocateable ML code relocateable

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-13 22:27:00 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <4jQj8.67487$Nn6.3426998@e3500-atl2.usenetserver.com>
Source record: 30588

Well, I've learned from a recent little ML project that it's really no big deal to make your unrelocateable code into a relocateable routine, and here's the kicker, without chaNging your JMPs into Branch instructions!....

Basically wherever you have a jump instruction or LDA absolute address instruction you put a label on that line
like :

```
.BYTE MYDATA
J1 JMP HERE
...
HERE ...
...
A1 LDA MYDATA
```

When you compile your code make note of the A1 and J1 offsets from the start of your ML routine, to make this easier start cmpiling at an even page boundry like $8000 then the offsets will be easy to read from the assembler listing....

Usually we want our ML routines callable in Basic so dim a string the size of the routine and you can even include data bytes in this string. Once you load this string with your ML code you can use ADR(ML$) to get the absolute starting address of the ML code and then poke ADR(ML$)+A1offset+1,new lsb of MYDATA based on it's new address ADR(ML$)+HERE.

It's not very useful for JMPs etc since it's relatively easy to convert to branches, however look at this code :

```
.BYTE XMAX
.BYTE DX
.BYTE X
...
LDA X
ADC DX
CMP XMAX
```

In many of our ML routines the values like XMAX and DX are initialized and not changed afterwards, so you can even do :

```
LDA X
ADC#DX
CMP#XMAX
```

This code is immediate mode addressing which is quicker for the 6502 to process, so to be able to provide the offset of these constants DX and XMAX from the start of the ML routine keeps the ML code at max efficiency while

giving the basic programmer the illusion that DX and XMAX are variables to be poked with whatever inital values he desires...

So it's possible to have your ML put into a string in BASIC once you poke the ADR(ML$)+offsets generated by the assembler listing with the correct values or absolute addresses in JMP's now that you know ADR(ML$)... Coding this way makes your ML routines as fast as they can be especially in immediate mode addressing....

I guess :)

1668. Re: Dead 800 tale of woe-- and chance to get my old stuff

I just had to do this to my two old 800's. I was suprised that it didn't
come
up. After I worked all of the boards in and out of their slots a few times
and
re-seated the major chips (I pretty much pressed on everything in sockets.),
it
came right up.

Give it a try before you give up on the old beast.

Hi Larry,

I believed the same as you until a few months ago when I upgraded my 1200XL to SuperVideo. The XE has the best stock S-Video output and the 800 has the best composite, however with the improved S-Video, the 1200XL output is absolutely stunning. I have a Jam also, but for the true retro feel with the most brilliant color saturation and sharpness, I prefer using a Commodore 1084S monitor.

-Dan

I won 1000 new Dysan Double Density disks on ebay for $20.

But the good thing about these are they are cased in cases of 10 disks and the cases are hard plastic with gold Dysan logo not those flimsy cardboard boxes! And I was wondering where I was going to get 5.25" storage cases, problem solved and in style.

It also just happns that I received my PooldiskToo 2CD set two days ago, so I got plenty disks to fill up and run on the real deal.

I feel like I'm no older than 20 years ago and jumped forward in time and got all this stuff practically for free!

This stuff is great! If anyone else has old ads please post them!

It's like finding an old VHS tape from the mid eighties that you taped TV shows on and looking back on the old shows and commercials. Back then those commercials were annoying, but seeing them almost 20 years later makes you scream, "I remember that commercial!"

1676. Dransik

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-14 03:44:18 UTC
From: baskar007@juno.com
Message-ID: <3c901998.60454309@news.bright.net>
Source record: 30497

Hey all. My name is Thomas, Aka Baskar, and I'm here to post about an online game called Dransik.

I wouldn't be doing this normally, but this game has brought back a lot of old memories. Remember the OLD Ultima's that we grew up with? Ultima 2 - 5? Well, that's what Dransik reminds me of.

Jason Ely (Lothgar) is the creator of Dransik. You may recognize his name. He helped in the development of Ultima 8, the Crusader games and also wrote the Ultima 6 Editor. That's how he got to know Richard Garriott.

The site's address is http://www.dransik.com
The game will be going OPEN BETA really, really soon. Also, the game will be going Pay to Play (not by choice), but it's not going to be anything like Ultima Online or like most MMORPG's prices.

Anyways, now to give some details on the game.
It is a MMORPG, meaning, you play with other people around the world. We have people playing from the U.S. (where it Originates from.. to be technical - Texas), Finland, Australia, New Zealand, Canada, etc. Some are mature, a lot aren't. PK is allowed and good and evil is distinguished between Red and Green. Guild Support is in, Skills, Quests, etc. Ships, construction, Government and a lot others are in the works. We also have a Message Board, but to access it, you have to get an account.

I'm also telling you about this because I know that a lot of us Atari Appreciators are at least 20+ years old. Yes, there might be some younger ones out there that appreciate the Atari, but we grew up with it, we programmed with it, gamed with it, and created worlds (BBS') with it. Basically, I'd like to get people my age and or older to get over to dransik and play. Most of the players at Dransik are teens and it's hard to socialize on their level. Know what I mean? I'm sure you do.

Thank you for reading this and I hope to see you on Dransik when it goes OPEN BETA in a few days.

Peace Out.

I guess I should. The thing just sends a spark of a signal to the
monitor, and it doesn't even come up in Memo Pad mode. Are you sure this
might be just a matter of corrosion?

That stuff is great, which is why I'm now re-reading my collection of
Computes I have from '82-'90 Shame I dont have any from earlier... :-(

Speaking of Early Magazines and changing the subject a bit, I have a huge
pile of Byte Magazines from '79 to '82. I see references to Byte around the
net now and again stating this and that about Atari, but in reading through
these Bytes, I'm certainly not seeing any Atari related stories. I wonder
if there is a index for Byte anywhere on the Net that may list specific
Atari articles, as it takes ages to 'flick' through these, they are huge
magazines! :-)

Anyone have any Antic/Analogs they want to trade? I have 30+ Antics
available. List available via email.

> with it.

Interesting you think the 130XE has the best quality. I found the XE games system to be the clearest. On all my 130XEs I have slight vertical dark lines all over the screen, mostly on the left half. On a solid colour screen it looks like it darkens slightly whenever Antic does DMA (a guess...). This is the case with all my PSUs and 130XEs... Does anyone know if this is just a "feature" of the composite output? Would I be better off building an SVideo lead?

Does look great on a 42inch TV though:-)

Hey man,

check out http://www.redshift.com/~cdyson/supervid5.html

Its a fairly simple mod. I'm no electronic genius so it took me a few
evenings, but I was going slow and watching old movies at the same time.
You can get all the parts at Radio Shack (get the big 1/4 watt resistor
assortment pack, I forget the part #).

You will be amazed at the video performance if you have a display that
supports s-video, such as a high-def TV or s-video monitor.

I haven't looked at XEGS. I would guess it is similar the the 130XE
and 65XE.

I have the XEGS. It has a composite out as the monitor connection. It looks fine on my 36" HTDV even though composite is like the lowest video signal. I was using regular rca jacks but when I switched to shielded it made a big difference in clarity.

Hello Eric,

look at http://212.82.234.115/atari/download/
You'll find a ATR Disk with ATARI Logo as a File (and LISP and some
other languages)

Ciao

> a scanline.

Indeed, I'm going from memory here, but I was playing around with
graphics modes a while back and managed to achieve that
GR.8-GR.9-GR.15 effect. To do it you set the DL to display GR.8
lines. Then set up a DLI that toggles the GTIA mode on after the scan
line has started, that gives you the GR.9 mode. Then toggle the GTIA
mode off again before the scan line has finished and it will give you
something that looks like GR.15.

I also remember trying to do the same thing, switching the GTIA mode
on and off in the horizontal blank (before the new scanline had
started) and ended up with something that looked like GR.15 but with
separate background and border colours (you can't set the background
and the border colours independently in GR.15).

The same sort of thing can be done with PMGs and the colour registers.
Biggest problem is getting the timing right.

Source record: 30514

Hmm -- fair amount of interest in this thread...
Here are a few other rambling observations/thooughts about the video.

My first computer was an 800, and after a short stint with a TV, I got a Commodore 1802 monitor and built a cable to use the chroma/lum. inputs. That was (IMO) the best non-vga combination I ever had. Then I got one of the first 130XE's, and that that one was close (using the same monitor). But the 130 had (faint) vertical stripes that are frequently mentioned, while my 800 had none of that. This 130 has been my "workhorse" for all these years, but was the recipient of the Super Video upgrade.
Then I bought a couple of 800XL's when a discount store was going under. I was absolutely apalled at the video. The text was so fuzzy and weak, I started messing around with the video resistors, and got the text some better. Years later, when I did the XL Super Video upgrade, I was amazed at difference that clipping that capacitor made. That was, at least on my machines, the main source of the "fuzzy" text.
I have never owned a 1200, but saw one after reading a review about how *great* the 1200 video was. Wow, the reviewer's unit sure didn't come out of the same parts bin that my friend's did! I've never seen one with the SV upgrade, but it has been widely reported as making a dramatic difference.
I also have a couple of XEGS's. And these have quite good video -- at least equal to the 130XE.
This *is* a subjective deal -- comparing different units over time, with different monitors, etc. But needless to say, the SV upgrades sure have helped a lot of machines!

1695. Conversion service for 8-inch disks

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-14 21:43:51 UTC
From: dutchman2000 <dutchman@atari.net>
Message-ID: <5P8k8.369$oa.290048@news20>
Source record: 30515

Conversion service available to convert 8-inch floppy disks to another more modern format.
This service is available to all classic collectors free of charge. Just supply the original media and the other blank media you would like it converted to. You will only pay the shipping charges to get it to me.

Some companies charge $300+ to just look at an old 8-inch disk without even telling you if they can convert it!

The goal here is to try to preserve these old documents and source code before they disappear forever...

Contact Me for more information.

I've put up a printout version of SpDOS Construction Set on
my site:
www.en.com/users/russg

or

http://my.en.com/~russg

It is intended to print odd and even pages on front and back of
pages. Print all the even pages on fanfold paper, turn the fanfold
over and print the other side. It is ATASCII EOLs for printing
from a real Atari. I suppose you could use an ATAS2ASC converter
and then print using a pc. There's also ATASCII<>ASCII converters
at the site.

From: Mike K <steakum47@hotmail.com>
Message-ID: <i6ck8.185161$s43.40894486@typhoon.columbus.rr.com>
Source record: 30517

Hello,

I just acquired an old atari collection. In this collection I received a 400, 800, 1050 drive and a 810 drive. I have all power cables, but didn't get a serial cable for the disk drives to hook into the computers with.

Does anyone have an extra they would like to part with? I'm looking to convert files for preservation. I also want to put these files up on my website which will be dedicated to Atari 8bit computers.

Thanks,
Mike

Top ten signs your wife is getting ready ready to A) throw out all
your classic computer stuff, B) throw out you AND your classic
computer stuff.

10) The Atari 800 setup in the guest room has worked out great, and
now you're going to focus on rebuilding your 225 cartridge Atari 2600
VCS collection in the living room.

9) You have to devote a third closet to your spare computer stuff,
this one's just for the broken disk-drives, printers, and modems.

8) You just won 1000 new Dysan Double Density disks on eBay for $20.

and so on... ;)

(These aren't as good as Dan's, but I wanted to hear the other 7.)
7. You stay up 'til 2AM programming your Atari.

6. You have work to be done on your wife's computer. For
three years you haven't done it.

5. You miss your 30th wedding anniversary to attend an
Atari user group meeting.

4. You find someone has set a magnet on your disk box.

3. Your SIO2PC cable blocks entrance to the dining room.

2. Your wife puts a TV in the bedroom.

1. Your wife joins a Hare Krishna group and a guy with an
orange jump suit and shaved head keeps showing up at dinner
time.

1710. Atari 800--->810 INTERFACE--->RS-232--->PC comm port?

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-15 23:29:16 UTC
From: Steve <avcrelecNOSPAM@attbi.com>
Message-ID: <3C9283D6.5B9DC0A4@attbi.com>
Source record: 30530

SINCE it has rs232 ports on it can it substitute
for the SIO2PC cable?

maybe I can just hook up an RS232 cable between the 810
and comm 1 or 2 on my PC?
and then run the usual program(s) mentioned in other posts?

thanks
Steve

Bobterm, AMODEM, etcetera on the Atari side. Hyperterm on the IBM side
should work. You will have to set the ports for the right speed.

I have all my old Atari hardware up on Ebay ending Saturday night. Much of this has gotten quite healthy bids, but please take a look if you need anything. Below is the link to my auctions plus a list of what I have for sale and its current bid at the time of this posting.

Thanks for looking!

http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=bobbyshaw@aol.com

Seikosha Axiom AT-100 Printer for Atari-- No Bids (Starts at $0.01)
Indus GT 5.25 disk drive for Atari-- $30.00
Atari 1050 disk drive-- $29.00
Atari 410 Program Recorder (non-working)-- No Bids (Starts at $0.01)
Atari 850 Interface Module-- $20.60
Atari 130XE computer-- $41.00
B Key 400 keyboard upgrade for Atari 400-- $15.00
Atari 400 computer-- $15.50
Atari 800 computer (bad spacebar)-- $9.00
Atari Joystick-- $1.25
Atari Paddle Contollers-- $0.01
Lot of 5 partial/non-working Atari Joysticks-- $0.06
2 non-working Atari Power supplies-- No Bids (Starts at $0.01)
Wico Command Control Joystick-- No Bids (Starts at $0.01)
Wico Boss Precision Engineered Joystick-- $0.01
Suncom TAC-2 joystick-- $0.01
6 foot Atari I/O Cable-- No Bids (Starts at $0.01)
Flight Simulator II-ATARI 8-bit XE cart+disks -- $2.50
Computer Football Strategy - Atari 8-bit disk -- $0.01
Family Cash Flow - Atari 400/800/XL/XE floppy -- No Bids (Starts at $0.01)
My First Alphabet - Atari 400/800/XL/XE disk -- No Bids (Starts at $0.01)
Shootout at the OK Galaxy - Atari 8-bit disk -- $0.01
Original Infocom Suspended Map -- $0.01
Original Microprose Silent Service Manual -- No Bids (Starts at $0.01)
Atari Juggles House manual -- $0.01

(Irving error, meant Irvine).
Uhm. Somebody mixed up an 810 and 850.
Sorry Paul.
Today I played with my Indus drives. I have two. One's better
than the other, but both have a problem with high sectors.
I have them open. There are differences in them, as viewed from
the top with case off.
They both boot, but testing sectors 700-720, I get errors.
The head goes back to 0 track, then back out to 38-39 trying
to read the sectors. I think the little block that a tab goes in
at track 0 is the track 0 sensor. I adjusted this on one, but no
improvement. There are lots of screws with paint on them,
I guess to tell if someone has messed with the screws.
Anyone with an idea why my Indus have trouble reading high sectors?
Russg

> What computers were used ?

It depends on the school. I went to school in Germany, too, and we had the first computer in 1985 or so. It was a Commodore PET with "1024 BASIC BYTES FREE." :-) Cute machine with a built-in monitor and tape drive. One or two years later, we had Apple IIs and later on, the enhanced Apple II - I can't remember the model.

Regards,
Thomas

PS: I started school in 1976. ;)

Hey everybody, My name is Jess LaFleur, some of you people here
already know me and some don't I run the Atari Computer Database
located at http://acd.atari.org

anyways back to my topic subject thing

How many people HERE that post HERE
live in ontario that are somewhat close to toronto?

I do know of the TAF, but they don't exactly function anymore
so ive heard in a recent email...

I just wanted to know for future plans/ideas/thingins

thanks,

Atari-Jess

Why auction is when you could always sell it to me for 20 USD?
please?

Mapping the Atari refers to software at one time available from the
Gateway BBS,
St. Louis, Missouri. Does anyone know if this software has been kept
by someone and may still be available. Thanks.

ron

Well, because the most important things, the contents are mint, I can't
blame the guy for advertising it as mint. I hope the disks are error free.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

Maybe they are as 'Mint' as the box ;-)

Seriously, the term mint has always applied to the whole package on
any collectable. When I traded and sold Marvel and DC comics back in
the 70's you dare not use 'mint' unless they *were* mint.

I completely agree - "Mint" condition means:

1) complete and
2) all parts (including package) are "Mint" (so, absolutely undamaged - even colors are not allowed to be faded)

> When I traded and sold Marvel and DC comics back in
> the 70's you dare not use 'mint' unless they *were* mint.

The same with trading cards etc.

Announcing an item to be mint suggests to the reader of the auction title that indeed all is mint, but in this case it is obviously not the case (as the seller admits in the description later). So the auction announcement is -mildly said- misleading.

I agree. The stuff is in excellent condition, unusually excellent
condition. He just shouldn't have used the "m" word.

Matt Ratcliff's programs:
1. one to turn BASIC on and off.
2. one to put BASIC in RAM and patch rev B
3. one called ram master, that puts the OS in RAM.

I'll guess you're looking for RAM Master. The other two
are probably also in the CTH archive.

RAM Master is in ftp.spudster.org:

\utilities\BBS\CARINA\FLESEC_U\DIR_A file ramaster.arc.

It is just the .com file and a doc, no source I think. Somebody
else asked about rammaster but never said if this is the correct one.

You can also find BASIC.ON and BASIC.OFF in utilities/misc
basiconoff.arc or something like that.

I'm sure a patch for BASIC 'B' is also there at spudster.

You don't have to go to DOS, to write DOS.SYS to the Disk. This command does
it for you:

OPEN #1,8,0,"D:DOS.SYS":CLOSE #1
But it's right, that you have to reboot.

(I don't see my previous reply.)
I now don't think the 'ramaster.arc' is the Matt Ratcliff one.
The RAM Master is a BASIC program. It is called RAM2ROM.BAS
and is at Kevin Savitz's www.atariarchives.org under the Mapping
The Atari section of programs. The other programs mentioned
are also there.
Sorry for the wrong info. Maybe you were (ron) the person who
asked before and I was pointing you in the wrong direction.
I'm sure this time.

Nope, wrong again.
I checked it out. The BASIC program from 'Mapping' is a different
program for moving OS to RAM, by Joe somebody.
Mat Rat's 'RAM Master' is the one I originally said, at spudster,
in the weird place it is under Carina/flesec_u/dir_a.
That ramaster.arc has most of a documentation with it also.
The Ram Master, according to 'Mapping' not only puts the
OS in RAM, it also makes it RESET proof, so it stays in RAM.

>
> Rick D.

Hi Rick, folks,

I was studying the several schematics on the weg concerning the 320K
upgrade.
The memory chips to use are 41256.

I owe an old mega st board and there are AAA2801P-10 DRAM chips on,
which
are as well 256Kx1 Bit DRAM's.

My question is, can I use these chips for the 320K mod?

Regards
Frank

Howdy *.*!

Another great 8-bit atari meeting has been held on saturday and was a
sucess in my opinion. It was much fun to play a multris - competition
(four player at-once tetris clone) and to talk with several atarians.
As every year the people had enough time to talk about atari, the
scene various other people and do what they love at most -- doin'
atari :-)

so I found many new contacts and I'm now a proud new member of
Foundation Two atari fun-group *g*

so did you played atari yesterday?!

-> I had!!

1750. Omnimon questions

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-18 04:46:50 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3C95713A.24276BB4@one.net>
Source record: 30470

Hello,

I'm looking for some Omnimon assistance. I have an 800XL with the Omnimon Ramrod board and Newell 256k memory upgrade in it. I also have a loose OmniView 256 chip.

Can I just insert the OmniView 256 chip into the empty socket on the Ramrod board?

Does anyone have any documentation on the Ramrod enhancement they could photocopy. Or, is the documentation on the 'Net somewhere?

Thanks,

-Bob

I know it's nitpicking (I'm not a hard-core collector myself), but a
"real" collector would find it important. Mint is just that - mint.
Untouched, pristine; absolutely perfect in every minute respect. It's
just a pet peeve of mine that "mint" is used so liberally on Ebay in
general.

You wouldn't be able to claim a valuable comic book with a bent corner
on the cover was "mint", so why is this any different?

Mike

Okay that's good to know. But I guess I should have been more honest when I made the post, I just wanted to keep it simple. What I want to do is use my Intex-talker speech synth which operates much like a 300 baud modem off the serial port. In Infocom games you can use the 'script' command to send output to the printer simultaneously. I was thinking the speech synth could 'read' the game to me and save my weary eyes. I know the synth can be reconfigured for paralell port use, but alas I have no manual for it and it has about twenty DIP switches under the hood. I guess I should go fire it up and try it out, it may work.
Thanks, Mo.

Hi, Mo!
Interesting idea, I used to do that with Scott Adams' graphic
adventure, Return to Pirates Island on my TI-99/4A, using "SPEECH" for
the printer name as long as I had a TE-II cartridge installed!
Too bad the other adventures didn't support output to printer. I don't
remember trying the Infocom adventures...

Maybe.

I found the AAA2801P-10 chips in the freetradezone database, but
unfortunately the datasheet is not available for free.

This means you simply have two possibilities if you want to use
your chips:

1) just build the upgrade and hope that it will work, or
2) find the datasheet and compare the pinout and specs to the 41256

Another possibility would be to look for 256k or 1M SIMMs (better
yet SIPPs, which are the same as SIMMs except they have pins
- just like normal ICs - and you don't have to search for a
SIMM socket). A good source for these modules are old 386 (and 386SX)
computers most people are just throwing away these days.

Just be sure the upgrade has built-in support for CAS-before-RAS
refresh (the Newell 1c design has it), so that RAM chips larger
than 256kBit will work.

so long,

Hias

It is probably getting to be time to move to a large static RAM to do
everything. There are a few problems with things like refresh on dynamic
RAMs, even SIMMs, that make it a problematic when working with an Atari.
Since a lot of designs use multiple chips the number of connections isn't
much different between say a 256k upgrade and replacing all the RAM in a
system with a 512k static RAM. Price wise it would be about the same too I
think. Last time I priced a 512k static it was about $5-$7.

1758. Rick Cortese maybe? Indus drive problems

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-18 18:23:04 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3c96308a$0$1427$1dc6e903@news.corecomm.net>
Source record: 30478

I posted this question in another thread.
I have 2 Indus drives. Both make errors reading high sectors,
tracks 38 and 39, or even sector 500 up. I've cleaned the heads,
have them open. They make the 'chirp' sound of Indus errors.
I use SmartDOS to check sectors and drive speed. The drive
speed is alright (288). Formatting a fresh floppy error 173,
SmartDOS format error, occurs at the 38-39 tracks. After
a couple tries the format completes, but still has problems reading
high sectors. Steve Tucker says maybe slow the drives down some.
Anyone know how to adjust the speed on an Indus? There are
two rectangular, adjustable resistors on the top board, anyone know
what these do?

Forgive me if you have already done this. First thing I would do is check with a different batch of floppies and check the pressure pad.

What I have noticed with several disks giving me speed errors is the surface coating of the disk has started to degrade/get rough and the disk won't rotate freely. Sometimes you get speed variations and some twisting.

The other thing is this kind of sounds like a classic pressure pad problem. The Indus was a single sided drive so it used a felt pad on top to apply pressure for the read head. Could be something else like head not being in the same plane as the disk, but pressure pad is there to make up for things like that.

Ah well, that's a good idea. When I started building and designing
hardware extensions for my 800XL some 15 (or maybe 17?) years ago,
static RAMs (with more than 32k) were really expensive. I didn't even
dare to think about creating a 256k _static_ ramdisk :)

I just had a look into a current price-list of a german company
(www.segor.de) and it lists a 628512LP-07 for 9,80 EUR (32 pin DIP
packaging, SO32 is even 0,90 EUR cheaper). OK, now I believe it,
static RAMs are much cheaper now than back in the good old days.

Another pro for static RAMs would be that several chips (like the
41256 or the LS158 which is used for MUXing the address lines) are
quite hard to get these days.

On the contrary, a lot of people (like me, for example :) have tons
of 1MB SIMMs, taken from old PCs, resting on their shelves. So if
you can re-use one of those SIMMs, building a 1MB extension is just
a matter of a few bucks for some 74LSxx and a few hours of time.
(OK, you don't save a lot of money, so the only remaining advantage
would be the "good feeling" that you were able to re-use an otherwise
useless piece of hardware).

Coming back to the design of a static ramdisk: That could be quite
easy IMO. You could discard most of the circuits used by standard
ramdisks, only cut the "RAM-select"-trace coming from the MMU
and add a small address-decoder (using A14, A15, and PB4, maybe
also HALT and PB5 if you want separate ANTIC access) to select
between buit-in RAM and ramdisk. Connect A0-A13 from your Atari

to the static RAM, and some PB pins to A14 and higher of your SRAM. Ah, well, and maybe a little bit of logic for Basic and Selftest if you want 512k or 1MB and still want to control it with PortB. So far for the rough design. Minor implementation details (like combining the SRAM-chip-select with PHI2) are left as an exercise to the reader :-)

BTW: any other ideas or just brainstorming about ramdisk design would be great - I'm currently thinking about building/designing a new ramdisk (my old AtariMagazin ramdisk has gone bad). 'til now I've analyzed the Newell 1Meg (rev 1.c) and Mathy's design. Both designs have their pros and cons. At the moment IMO the optimum would be a slightly modified Newell ramdisk (adding a switch to select between a 512k 130XE compatible ramdisk and a 1Meg ramdisk) extended with Mathy's latch for basic and selftest (or a simple logic that switches off both basic and selftest as soon as the ramdisk is selected - that's mainly what my old 1Meg design was doing).

So, if you've got any ideas about which design you like best/worst, just tell me about it. Any input would be great!

so long,

Hias

Thanks for the response, Rick.
I have used/tried several disks. The drives are open, so I can see
the top surface on the disks thru the opening. The disks look
shiny and clean.
I thought of the pressure pad. So while it was trying to read
a high sector, going back and forth to track zero, giving
G4 (crc error) or G5 (record not found error) beeps, I was
saying I put pressure in the top peice that has the pressure pad to
see if it would read the sectors better, with my finger. I actually
put enough pressure a few times to stop the disk from turning.
Probably not a good practice, but I think I proved to myself that
the pressure pad wasn't the problem.
I'm thinking it is an electrical problem, not an alignment problem,
as the same errors occur if I format a disk on the drive, then
try to read it. I used a new, never used disk and got errors
on formatting at the high sectors. After a few tries, it formatted.
It seemed to read ok immediately, without taking the disk out.
But once re-inserted, it still had problems reading.
Someone said a head could become magnetized, but thought that
applies only to metal heads like for tapes.

And you ask this on the 8-bit newsgroup?
The simplest answer is "that's why external modems (RS-232, not USB!) and
A/B switches
were made".

(dadgum replied to myself in e-mail, instead of here.)
Larry told me R31 sets Indus speed. Tried it, there was
some improvement. I have a us dblr 1050 that reads and writes
the several test disks I'm using, so I know it isn't a problem
with the disks. (This 1050 even reads and writes a floppy I formatted
on my PC 1.2 meg 5.25").
There are 5 adjustable resistors on the Indus. R31 mentioned,
R12, R1, R2 and another I can't see the number.
Anyone know what these other adjustables do?
I set the speed, using SmartDOS to read speed, to 285 and
tried even lower, they were 289 to start with.

Hey Thomas,

You are right. it was a great meeting. I've posted a short summary (german) in the forum at http://www.abbuc.de , for all who can read german.

I liked the 8 player worms game (Cervi) very much.

Ciao,
Michael

25 quid for a CD full of pirate warez??????????? nah mate I'll just
download them from the alt.binaries.* groups

1773. S.P.A.C.E. Action! tutorial

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-19 15:47:18 UTC
From: Brett Cammack <trm105@hotmail.com>
Message-ID: <a4Jl8.245$Jc5.22963@bgtnsc04-news.ops.worldnet.att.net>
Source record: 30494

Trying to teach myself Action! some 20 years after I sold off all my Atari stuff, including Action!, which I never really wrapped my brain around so early in my career.

I'd love to find an electronic copy of the original manual somewhere, but no luck so far. I found the old "Larry's Action! Tutorial" from the S.P.A.C.E. newsletters on line. Unfortunately, installments 3 thru 12 are missing. Anyone know where I may locate these issues? Is there anything out there that might better serve me?

Regards,
Brett C. Cammack

1774. Copyrights and old Atari stuff

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-19 16:09:35 UTC
From: Brett Cammack <trm105@hotmail.com>
Message-ID: <3pJI8.275$Jc5.25375@bgtnsc04-news.ops.worldnet.att.net>
Source record: 30495

I've not posted to this group until today, but I've been reading it for a few weeks now and have been combing the archives of it on Google.Com. I did a Google search on Atari 800 as a whim a while back and was astounded to find such a broad, rich, and comprehensive community of support of these fine old machines. To find three or more excellent emulators available at no cost for the PC was amazing! Suffice to say I've had a ball refreshing my memories here on the Internet.

One thing has sort of bothered me, though and I'd like to make an observation regarding the issue of making "copyrighted material" available. After studying the law on this subject and reading various posts by folks like Bill Wilkinson about not distributing his works even though the rights have been sold and the current owner has vanished, I have concluded that I will staunchly support copyrights within the intent of the law which I determine as follows.

Federal copyright protection is constitutionally finite, despite the legislative body's "fudging" the constitution by extending duration of protection every few years. (a case is pending before the Supreme Court on this matter at this time) Federal copyright law was intended to protect the author of a work for sufficient time to afford a reasonable return for his or her efforts. It was never intended to be a perpetual entitlement. It is supposed to be a quid pro quo that says, essentially, "I'll provide legal coverage for you to protect your work for a reasonable amount of time so you can earn a fair living from it and then you must give up your work to the public domain so all may have free access to it." This is rather like Federal patent protection laws.

With this in mind, we are dealing with 20 year old, eight bit examples of what is essentially archaic technology. I don't mind picking up something like Action! or BasicXL for twenty, thirty, or even fifty bucks as a complete, supported product somewhere, but those days have now passed.

The original authors aren't getting a cent from the high prices being obtained on Ebay, nor are they producing any more of the product. Does the proprietor/owner of Fine Tooned Engineering (if it still exists as a business entity) intend to produce more product? Has any effort been made by this party to defend any ownership rights to any of they intellectual property? Even to the point of a simple post or a message passed via a 3rd party saying, "Gosh, guys, please don't copy that stuff!"? Not that I have been able to detect.

Patents, copyrights, and trademarks that are not defended in any fashion are considered surrendered to the public domain. This has been confirmed by decision of numerous courts.

IMO, it is analogous to not making a photocopy of the Mona Lisa because Leonardo DaVinci still has the copyright on the image and we wouldn't want to do the wrong thing.

Let's support the active body of contributors to the 8-bit Atari community, acknowledge past contributors, and not ham-string ourselves with concern for parties with a demonstrated lack of further interest in it. Let's respect the rights of those who still care about the property they once created and are still collecting revenue from it.

Obviously, these are only my opinions and everyone else is certainly entitled to their own, but I do believe that some sensible dialog is necessary about this subject before the 8-bit Atari enthusiast community withers into a collection of fusty old collectors who've driven the prices of materials out of the reach of the average bloke.

Regards,
Brett C. Cammack

Hi !

In order to get the datasheet of the AAA2801P just search for AAA2802
at freetradezone. There you get the datasheet for the AAA2800 serie.
This pdf-file contains the datasheet for AAA2800 and, what surprise,
AAA2801.

Unfortunately I am not able to tell if these chips are fully compatible
with the 41256, at least they have the same pin-out.

Regards
Frank

> ALGIA+GAMES+CD+#1&amount=25.00

Hmm. Hotmail e-mail address, PayPal payment, hundreds of games made by
different manufacturers, advertising through e-mail...

Definitely just someone who burnt a bunch of warezed games to CD.
There's no way that those are legitimate, licensed copies of the
games. It's one thing to pirate old games, it's quite another to try
to make a tidy profit for yourself off other people's work... $25,
even if it includes shipping, probably works out to about .25 for the
blank CD and maybe $2-3 for shipping, so about $22 of profit per CD
sold... very naughty. Avoid this guy, it's a ripoff.

Also, it looks like it's related to www.bhlegend.com, which is
apparently located in Bosnia, somehow I suspect that the copyright
laws aren't being enforced very stringently. Note that what appears to
be all the games on the CD (or at least 461 games) are available for
download from that web site.

I'd still be checking for something mechanical. Maybe check the wires going to the head for breakage.

I guess trying to demagnetize the head couldn't hurt. I'm not familiar with the read amp on an Indus. They should be adjustable but it is not really something you should try with out a scope.

Uhm, Brett.
You'll find lots of ACTION! info at ftp.spudster.org
under the programming/ACTION directory. Stuff like
ACTTUTOR and ACTREF.

A question just came to mind.
You're interested in ACTION! Do you have the real thing,
or do new emulators have the ability to run it? I think some
effort was being made to run the super carts, but didn't know
if it could be done.

1782. Re: Copyrights and old Atari stuff

hi,
you should be real careful in what you are advocating, i have ran into a few authors who would rip me to shreds if i did not get there permission, even though its been out of print for many years, others simply do not care.
some stuff is so contested that it is hopeless, so who cares, some stuff was bought up on the cheap by jack, and never released, then sold off cheap.
some stuff gets released by the publishing companies, and they say that its not worth defending, then later the rights revert back to the original author, and they might not be to happy even if you got good information from the original publishers.
either way i always try to get permission if its possible.
thanks,
lance

Hi, Rick.
I don't think any wired are broken.
Right, don't mess with the read amp without a scope.
I have a Heathkit oscilloscope. I figure I'd hook up a ground
and signal wire someplace and make settings on the scope.
I don't know how to use the scope.
I adjusted all the 4 unknown adjustable resistors, but no improvement.
I remembered where they were, did 1/2 turn clock and 1/2 turn
counter clock and then back to where they were.
There is a read amplifier you said, didn't know that.
I have a new unused 1050 mechanism, and there is a SPACE newsletter
that describes putting a 1050 mech in an Indus. I'm researching
that right now. The author said his Indus was getting errors and he
swapped out all the major chips with no avial, so he put the 1050
mech in the Indus. He figured a bad/marginal read/write head, which
is what I'm thinking.
Wish I knew how to use this scope. My mother assembled it
probably 40 years ago. It still works.
Russ

If the Ramrod is the board which came with Omnimon containing a 3-way switch and 3 OS sockets, then yes you can put Omniview or any other OS on the board and toggle between them.

No, the last time I saw a copy was going through the Byte archives
at college 10-12 years ago. I'll keep an eye out for it though.

My recollection is fuzzy, but I do remember it swapped different sized
banks from the 130XE, IIRC it was 32K instead of 16k.

Yes! In fact, there's an Action.Com file on the spudster ftp site
that you can simply load as a binary file in 800Win and XFormer.
Someone else (I've bounced across so many URLs I have trouble keeping
track) who was tinkering with the Atari800 emulator on SourceForge has
'.rom' images that can be loaded as cartridges within that emulator.

Never really getting a grip on Action! way back when is a sort of
"unclosed gestalt" of mine. I'm looking forward to having some fun
with it.

I certainly do not dispute your experience or opinion. My point is that I don't think it's sensible to tip-toe around because someone who nobody's heard from for, apparently, years, _might_ be upset, offended, or otherwise miffed about the publication of something that once had value a couple decades ago. I'm perfectly willing to respect the intellectual property rights of people, particularly when those rights represent genuine revenue generating potential that are being persued by the rightful owners.

The framers of the Constitution did not intend for the assignment of copyright to be an entitlement in perpetuity. A year in computer technology is roughly the equivalent of dog years, squared, so, like the t-shirt says, in dog-years, the value of any intellectual property contained within the reference manual for, say, OSS Basic A+, is dead. <g>

Healthy dialog is good. I appreciate your thoughtful response.

Yes copying old 8bit software violates copyright laws. Can you walk into Best Buy today and purchase this software? Nope! Maybe if you are lucky you can find a worn out copy of it at a flea market or on Ebay. Will the Author/Company receive any money from the sales of this old software? Nope! Is this software becoming scarce and more hard to find? Yep!

I believe in preserving this stuff. If I were an author of some old software that was no longer being sold and I saw a copy of it on a web site, I'd be honored that people were trying to keep it alive by distributing it. Lets face it, old software like this is fading away. If someone posts a copy of it on a website, sure people might download it. Those same people may even give a copy of it to their friend. They are enjoying it and at the same time keeping it alive. If someone sees this software being copied and blows the whistle, chances are the law will not back it up. Lets say the law does, now that software is taken down and only a few people will actually pay $50 for something that will give them a quick nostalgic feeling. Will they continue to use this software? If they are a die hard fan they might, but chances are they'll use it a few times, then put it away in their basement. Sure they did the right thing by purchasing it, and now the author is $50 richer.

Again, if I were the author and I had created a bunch of top selling software 20 years ago that is obsolete today, I would create a website and give my stuff away. I'd let anyone copy it as much as they wanted, and I would feel good that I was bringing back the spirit of that old software and making people happy. Otherwise I could just blow the whistle on anyone that copied my old stuff. Take them to court and walk away with a little money, but what have I gained? Sure I won some money. Sure the majority of people out on the net feel I had the right to do this, but did I over react?

Should we be like the Bill Gates and count every penny of the software we sell, or be like the Steve Wozniaks and create the software for the bettering/entertainment of people?

I purchase all my software that is selling in stores today. If it's no longer being sold and the company/author has no way of making money from this software, then I will copy it. I copy it to share with others in hopes it will strike an old flame in them to power up their old computer and give it a use rather than sit in a basement. It just depends on how strict your morals are I guess. I have good morals, but they are not perfect.

My idea is... Pay for the software, but if your sales booth is gone, don't get mad when people want to keep something you created that you don't want to support any longer alive. Be honored. I am not targeting anyone on this group, I am just stating how I feel about copyrights and old software. I'm here to just learn and have fun.

O.k., it is the board (for the XL series) that has three sockets and a
DPDT switch.

I put the Omniview 256 chip into the empty slot but the machine wouldn't
boot with the switch set on the third position.

I then removed the Atari OS chip and replaced it with the OmniView 256
chip. Again, nothing.

Is the Omniview 256 compatible with the Omnimon XL (Ramrod XL)? Or does
it only work with the 800 version of Omnimon?

> Is this software becoming scarce and more hard to find? Yep!

But, what about games like Asteroids, Battlezone, Centipede, Tempest,
Boulder Dash, Dropzone, Spy vs Spy?

All of them are old and obsolete 8bit games and they're not sold anymore
BUT that's true for Atari 8bit. All of the above still have some
marketing potential and all of them are sold now for modern platforms.

I would also like if the publishers made everything freeware for
obsolete platforms, but now the situation is:

1) Program is already freeware/public domain (good!)

2) Program is copyrighted, we (think we) know who owns rights but
refuses to release it
a) because they are not sure if they own it (Broderbund/Synapse)
b) they simply don't want (ECA?)

3) Program is copyrighted but nobody knows who owns the rights.

The Atari should go the way of the C64 and Spectrum where the authors are quite happy for their work to be treated as freeware as it's no longer sold and really are just happy that it is still proving entertainment.

To be perfectly honest there are few hardened vendors solely selling *software* these days that rely on it to keep the business going, personally I find the idea insane if that's what they do. Obviously people who have obtained permission and or copyright should have the ability to try to enforce their rights if needed ala a website giving their game away etc but I feel anything more will just damage the lasting community.

My only beef is with people selling collection on places like Ebay for personal profit ie for $25 etc.

Use precision sockets for all chips (2 RAMs and 1 CO25953).
The xx256 RAMs are not pin compatible to the xx64 chips.

Two questions:
Could you please write an ASPI manager for your interface?
Could you please write an ASPI version of your software, so it can be used
with the ASPI manager? (currently the only ASPI manager is the one for the
BlackBox. For more info on ASPI please check out my ASPI page at

This limit of BB config parameters, are they hardware or software limits.
If it's limited by the BB's OS, you could get around this by replacing the
BB OS by a FLashROM.

Jasen,

The memory upgrade information is in the manual. If you don't have one,
look here.
http://www.atari-history.com/archives/atr8000.pdf
You just need 8 - 64K chips (200 nanoseconds or faster). These are the
kind found in old IBM pc's or on old pc memory boards. Set the jumpers
according to the manual and you're done. I don't know where you can find a
drive case unless you look on eBay.

> to me so I ordered it. I'm curious to check out the alkabeth and the ultima
> moon thing.

I just get very, very uncomfortable at the thought of someone making a
healthy profit off programs that they have no right to. It's one thing
to give someone a copy of a old game or to allow them to make a copy
of your copy of it. It's something else entirely to make a good-sized
profit off of those copies. That seems to be very low to me. I've
certainly got a good-sized collection of, for example, Atari 8bit
stuff that I don't own licenses for (though I do legally own quite a
bit) but if someone wants a copy, I'll just give it to them, trying to
make money off of it is just plain wrong.

If the guy was selling the CD for $5 including shipping, then maybe,
MAYBE I could be convinced that he was actually interested in keeping
the old games alive. But $25? Blank CDs cost virtually nothing in
large quantities, modern CD burners can burn a CD in about three
minutes, and shipping is fairly cheap. That's hardly $25 worth of
work. Or look at Pooldisk - isn't someone selling that for only $5? At
the most, it was $20, right? From what I understand (I don't have a
copy of it - yet), a ton of work went into that, yet they're happy to
sell it for $5, and this other guy does pretty close to zero work and
wants $25...

i certainly agree with some of everything that the posters are saying
except paul irving, i never thought that what i am doing would be viewed
as insane!
without me there would be lots of actual atari users who are not
internet users who would be left out in the cold, and forced into
another machine against there wishes thus really harming our market.
i am told this by my customers everyday, infact the majority of my
customers do not have internet access, nor want it, so what are you
going to do with those people paul, tell them they are out of luck, and
download it off the web?
e-bay is a good place to find hard to find stuff, and e-bay is also a
place that a lot of my present, and future customers get screwed. e-bay
has been good to me because desperate people who are looking for this
stuff buy a machine that they are told it works, but it does not, so
they come to me for repairs, or to buy a machine. many get a good deal
do not get me wrong, and they still come to me for something that they
cannot find on e-bay.
there are many many people who just want to relive there childhood
nostalgia by opening that box with pacman in it, rather than download a
image, and playing the real thing is what they really want to do, why
eat hamburger, when there is still steak available.
that is why i do what i do, and the people that help me are wonderful,
and they understand it.
i would love to publish everything, infact there are a couple of titles
that i am uncertain about and it might be hopeless to ever find the
owner because they are contested, so i did them anyways.
then there are most cases where the authors are really happy and quite
nice about it because they do want to see the stuff out there again for
the actual users, and are really happy that i would ask them so that
there is no discomfort on there part.
then there are certain ones like electronic arts who in no uncertain
terms told me that if i do it, be prepared.
also a certain author of two really neat games who will give them for
free to emulator users, but would not allow me to publish them for the
real users, now there is a real humanitarian, free for some, but not for
the users that it was originally intended for, the two games will remain
anonymous, but lets say you are a little guy who likes to be in mines:)
so this is a mixed bag, you do what you want, but if someone does come
forward you might not like travailing to the state they reside in to
appear in court, that might never happen, but who knows.
i am also really frustrated, i would love to do FTE stuff, it is really
holding back the community, and i think thats what a lot of the
frustration comes from, maybe he will budge someday.
thanks

lance

Actually I bought the Pooldisk Too for $20 I think. I can't remember if shipping was included.

They took the time to compile the CD so I guess they're entitled to sell it for whatever they want for some of their time invested. Look at it this way, there's no reason to get upset because no one's holding a gun to your head saying, "Buy this CD or else!"

:)

it.

True but here is the problem. Let's say you were a software author back in the 80s and lost a lot of sales and commisions due to piracy. I mean there are games that never even saw the light of day because they were pirated before they were even released.

Now I know for a fact this created severe financial hardship for more then a few programmers. This was more then a trivial issue for them, lost the house, wife left, little Jimmy has to go to JC kind of stuff.

Believe me, some of these people are still major PO'ed. Lot's of them got over it too of course. That is why it is important to ere on the side of caution. I mean Steve Jobs and Steve Wozniak had their pay day on Super Breakout and got lucky with much bigger things since them. I doubt if they care if there is Super Breakout warez going around. A lot of people weren't so lucky.

Lance, you might have read the post a bit more closely before knocking me. I said only that if anyone fully expects to finance a business solely on 8bit *software* <------ sales for any length of time that I view it *personally* as insane.

Unless you have nigh on zero overheads and no payout for supplies then I can't see how a software only item can last. I never said it was a bad thing or you were doing something wrong, in fact all power to you.

> without me there would be lots of actual atari users who are not

Perhaps the author didn't want people to make a profit on his work?

And before you decide that's an attack at you please understand its
not. Many authors quite publically say that their items are free as
images but they may not be sold.

Again, that's their right, if they are not making money from them then
why should anyone else.

> i am also really frustrated, i would love to do FTE stuff, it is really
>holding back the community, and i think thats what a lot of the

Hello, Rick.
I found out that it is probably the disk read amplifier. A mc3470ap.
I'm trying to get a couple. They may be in old pcs. I don't know
if the floppy controller in pcs used the same chip or not.
It'll be about a week and I will be able to try that chip. I also
got some of the other socketed chips to try if the mc3470ap
(nte3470) doesn't fix it.

My question about this retro-game CD is what will the pc use
to run the programs? Do they distribute emulators with it?
Or are these supposed to be original games, but just cheaply
rewritten for the pc?
Maybe this was answered someplace in this thread.

paul,
i am not knocking you, nor were you knocking me. most people do not understand what is left of the atari market, and are simply amazed that anyone is left selling the stuff.
if your post is about strictly software, you are right, but software makes up the overwhelming majority of my sales.
having been in this business for about 19 years my overhead went from about three stores down to today a warehouse with a office that is a much, much lower overhead, and that is how i stay in it.
in that length of time i have 1000's of customers on file, and most tracked me down thru atari themselves, word of mouth, buying garage sale atari's, and finding a old catalog's of mine, writing letters to newspapers. i have been interviewed by at least 6 major newspapers, and once that happens you get put into a data base that many papers use to answer questions from letters sent to newspaper columnist's that provide help to the public, and of course now the net.
but most still come from the mail, and the phone, its amazing.
i pay royalties on many of the games that i publish, just ask scott adams of adventure international.
i fully understand if a author does not want there game published, if one conveys that to me, i will not publish there work.
no hard feelings, i was not offended by what you said,
thanks,
lance

Bob - After digging around, I found the original Omniview80 disk that came with my Ramrod XL. It's a pretty decent 80 column word processor for the OmniviewXL. I also found a few pages of instructions an installing the RamrodXL board, which I scanned into PDF format. I'll send them to you if you want.

Good to hear, i'm still amazed that so much of your income is software based tho. As long as it's turning over then that's the main thing!

> in that length of time i have 1000's of customers on file, and most >tracked me down thru atari themselves, word of mouth, buying garage sale >atari's, and finding a old catalog's of mine, writing letters to >newspapers. i have been interviewed by at least 6 major newspapers, and >once that happens you get put into a data base that many papers use to >answer questions from letters sent to newspaper columnist's that provide >help to the public, and of course now the net.

No disrespect but I never thought that your services were THAT well known, I presume most dealers as being very 'working out of the back room' people.

Well done that man..

> i pay royalties on many of the games that i publish, just ask scott >adams of adventure international.

Not trying to pry but I hope it's not too much..

> no hard feelings, i was not offended by what you said,

I hope not, it was never meant to be an 'attack' or even personally pointed at you at all. It was merely my thoughts on how I would like to see Atari people think about the way software should be archived.

I owe the old Atari a lot, it not only gave me massive entertainment then (and now) but it put the food on the table back then and opened

doors to other area's like game dev and magazine work. I just never thought that there would be that many people who could make a living from it these days..

Keep it going!

I ordered the disks for the Sonderheft... I still have copies somewhere but the originals disappeared years ago.

I did, however, type in Happy DOS from the listing... don't know what I was thinking.

See the umich archives, or its mirrors. Robert C. Arp wrote a DIY book
on that topic, with text, files, and images separated, but for ST 68000
only. Printing it out as a book is a large project, but not too large.

Well, I respectfully disagree. They did not code the games, they
probably don't own the games, and compiling the CD is hardly any work
(again, compare the work to compile the Pooldisk CD.) They are merely
profiting off (many) other people's work.

It's no different that copying old videotapes and selling them for a
profit, or copying music CDs and selling them...

As for the emulation question, these are actual released games, back
in the CGA/EGA days (in other words, graphically and play-wise they'll
probably pale compared to every Atari 8bit games)... generally you'll
have a much better time downloading MAME and playing the original
arcade ROMs, or using an emulator to play the Atari ST or Amiga
versions of the games. It might even be easier, these modern PCs don't
always play nice with superold games. On the other hand, they will let
you hear your internal PC speaker do more than "Beep!" when you boot
up. :)

I don't think it's as bad as that. These games are no longer being sold or
supported. Music CD's are always being sold. No sales are being deprived of
in this case, whereas with music the artist is being deprived of sales. The
CD has some 700+ games so I'm sure it took some time to put them together.
How much time do you think I'll spend trying to download 700+ games? it's
worth the $25 to me to have it conveniently put on a CD shipped to my door.

I typed in Happy-DOS a while ago (again...) and you can find the ATR at my
page (I added it a few days ago).

Actually, I never used SpartaDOS or the other DOSes. Happy-DOS is short,
quick and great.

You could have saved some time by doing a search on the net since I have it on
my page since a long time (Happy-DOS + BASIC listing to create binary) :-))

: Actually, I never used SpartaDOS or the other DOSes. Happy-DOS is short,
: quick and great.

But... Happy-DOS can only acces up to 360KB floppies and only acces D1: - D4:
(plus a Ramdisk) which is a problem if you use harddisks with partitions up to
16MB...

I suspect scenario 3 is likely for a lot of 8bit stuff. Personally I dont copy anything until I know its not gonna be a problem. Luckily in my case I got quite a few of the 8bit programs when they were still available and kept them in good shape, and afterwards from dealers of NOS (new, old stock). The stuff I managed to find is in quite good shape and a far cry from "ragged worn out disks on ebay".

Perhaps a good idea (which has probably been tried before) is starting a project to find who has rights to what and re-relasing older 8bit stuff, perhaps as freeware or shareware. I wouldn't mind paying a few dollars to some programmer for a program I missed out on the first time around.

Damfino wrote

: Well, I respectfully disagree. They did not code the games, they
: probably don't own the games, and compiling the CD is hardly any work
: (again, compare the work to compile the Pooldisk CD.) They are merely
: profiting off (many) other people's work.

The authors of the Pooldisk are living 20 KM away from my place. I know them personally and have visited them several times at the time they were compiling the first PoolDisk...

They sent mails to any PD-library guy to ask for permission to place the disks on the CD. They PAID for most of the PD disks. They mailed a zillion times in about any Atari related NG to ask for software of any kind as long it was shareware or public domain. They copied thousands of floppies to PC to make ATR images of the disks using the SIO2PC software/hardware (no idea how much 1050's they ruined in the process). They wrote PC utils to view, extract, create and list ATR/XFD images. They bought the equipment to make CD's, only to make the PoolDisks, at a time they were extremely expensive. They burned hundreds of CD's, one by one on that 2 speed burner. They spends thousands of hours to sort and test all ATR's. They downloaded for hours to get every single file I had online on my BBS (you have to pay for every second you are connected over here in the Netherlands, that includes connection to the internet too!).

I don't think you can talk about profit. They never will make any money if talking Atari and will never do. They were also CSS retailer way back, also non-profit. You paid what they paid.

Besides of that, all files on the PoolDisk are free to copy EXCEPT for some commercial games. They were placed on the CD with permission from the copyright-owner (ANG). These are games of at least $5,- each, so do the math.

These games are also the reason you may not copy the whole CD. You'll have to exclude that one particular directory when making a copy for someone else...

Ok Dennis, what have you been doing snooping around my house? At least you could get it right, the Atari 2600 collection is 60 carts in the same room with my 2 8bits, 3 setup st's, 4 other computers and 4 more sts in storage. Btw, the 8bits not in the guest room but I am since I can no longer use this room as a bedroom. How all that computer stuff leaked out of the closet I'll never know.

I got 2 full boxes of disks a couple years ago at a neighbours garage sale for $5 a box. I got hundreds of blanks now. I wish I'd found this deal back in the mid 80's even then I'd have enough blanks to keep my 8bit going longer than me.

Hi, Andreas;

It was *Claus* Buchholz (is that 'Charles' auf Deutsch?) in Sep '85 BYTE called "Quarter-Meg Atari 800XL". I found a copy of a copy with some dropouts, but mostly readable. It banks in 32K blocks and works from code in the RAM OS replacing the international character set. The software is not provided, only instructions to find the source code on the BYTEnet Listings system. There are two schematics depending on your U27 video controller being CO21687 (8-bit refresh) or CO12296 (7-bit refresh). The former uses a 74LS153 and the other a 74LS151, 74LS393 and 74LS00. Both small boards patch into the socket at U27. I had heard that Claus had redone his design for 16K bank compatability after the 130XE was released, but never gotten a copy of that.

What else do you need to know about the details? If I can retouch scans of the diagrams, I might be able to generate a machine readable article.

If you're talking about the 4164s and 41256s, well, they only differ in a single
pin. Now, 4464s are another thing... (the "1" after the first "4" in 41xx or the
second "4" in 44xx stand for the way the memory is organized... 4164=64x1-bit,
41256=256x1bit, 4464=64x4bit...)

Howdy Marek, folks

I've brows the english docs and have a few questions about the SIO2IDE.

After it's prepared, can I use it just like a normal drive. I mean, save, load and use a sector editor?
How do ATR files get on there? Do I have to save all files as ATR? If I save an ATR, can I read it as if it was a normal disk?

I read something about a master/slave switch. Does that mean you can have only 1 IDE device per SIO2IDE and maximum 2 SIO2IDE's per computer?

Add me to that list if possible..

I did the OmnimonXL docs OCR a while back which most people have now
had so these would be an excellent companion.

I just had a short look at the datasheets and as far as I can tell
the AAA2801 seems to be compatible with standard 41256 chips.

so long,

Hias

Well,
a good friend of mine is a very fast typer (5000 chars or even more in
10 minutes). He typed in the whole TB listing within some hours. and it
worked right from the start (no typing errors!). Cool man !!

Besides that, Frank Ostrowski never published a real Source listing,
just that type in listing. But long time ago some Atarians in former
"German Democratic Republic" (now: eastern germany) dis-assembled the
whole thing. I know who they were, but guess what: they left the Atari
scene long time ago and gave their Ataris plus software away. Until now,
we have not found the buyer (since he moved to a new adress). As long as
he did not throw away the software (and the source code), there is some
hope, that the source will be found some day. Just keep waiting...
-andreas.

Source record: 30389

Well,
let`s imagine a CD-R costs 50 cents (or maybe less) and you spent some
hours or days filling it with Atari Images (ATR, XFd, DCM or whatever).
Think it would not be to unkind to "sell" it for one to five dollars
(plus p&p if outside US). Since you will hardly find more than 100
buyers, you won`t be a millionaire then...

Or imagine, that the CD contains some selfmade programs/images, lets say
5 images. You may sell the CD with just these 5 images for five dollars.
No-one will complain because of copyright (but many will complain for
the unused space). So, you decide to fill the CD with your own 5 images
plus 995 extra images that are not-selfmade. Guess what, now no-one will
complain for unfilled space, but because of copyright reasons (they say
you are making money with it). So you decide to sell only 5,25" Atari
disks - and now all emulator users will complain, since they cannot use
the 5,25" disks. so finally you notice, that you cannot fullfill the
needs and wishes of everyone and to avoid any complaints you give up.
You do not sell anything and furthermore you do not program anything. Is
this what you want ?!? I do not think so... -Andreas.

But alas,
Happy DOS 4.5 is not fully DOS 2.5 compatible. The update of Happy DOS
was called DOS II+D Vers. 6.1 (also by Stefan Dorndorf). It added double
density, use of batchfiles, etc. - but is still not DOS 2.5 compatible.
Later Stefan did XDOS, which is DOS 2.5 compatible, does 180k and even
360k, but he never officially released it to the public. He wrote about
it in a letter - and when I asked him about this DOS version he kindly
gave me a copy. It still looks like DOS XL (just a DOS.Sys, no menu just
a CP), but can do much more. Unfortunately I do not have any docs for
it... -Andreas.

Well,
not everyone needs/uses harddisks with the little Atari. Besides, are
there any Spartados programs to rescue a crashed harddisk (rescue
data/files, undelete files, recover files, etc.) - or are you always
risking to lose files when harddisks go bad sooner or later ?!?
-Andreas.

With the AMPEL program you CANNOT make a typos because each line is checked
on input (you have to type in a checksum on each line). A friend of mine
typed in Turbo-Basic back then, but I don't know how long it took him. :)

Well,
I wasn`t talking of Charles Buchholz, this was Aaron Wheeler if I read those quotations right (besides Claus is also common in german, but Klaus is more common). Now on with serious things. I would like to know which banks this upgrade uses (just 16k banks or 32k banks is not enough info). Take a look at my ramdisk info text in the A8FAQ or here in the newsgroup, maybe you already have the info I need. Next, I would like to know the control bits for these Buchholz upgrades (if possible for any buchholz upgrade found, i.e. the 32k bank versions and the 16k bank versions). thanks - Andreas.

You'd be surprised how little effort it would take to round up a CD
full of old games. Hell, just watch alt.binaries.warez.ibm-pc.old
(that's probably not exactly correct, but there is a group just for
old games) for a couple days and you'll be able to easily nab gigs -
many gigs - of old games, and as noted before, the games on that CD
are available for d/l from that site. I'm just annoyed to see someone
out to make a fast buck for themselves off this stuff. Ah well, it's
not worth spending any more time discussing. :)

As for Fox-1, I'm not sure if you understood me properly or you were
just expanding on what I said, I definitely feel that a ton of work
went into the Pooldisk, from what I've heard... as I said, I still
don't own a copy. It sounds like there's been a couple different
places that have sold it, do you know what the current process is to
buy a copy?

OK, I'll jump in.... Please do not copy any of the old OSS stuff that has not been specifically designated as distributable. I have a vested interest in them and, although I do not actively search for violations, will ask anyone who may be posting them or discussing such posting to stop. (not stop the discussion, just the posting)

I agree that it would be really great if we knew who actually had the rights to the 8-bit stuff and what their attitudes were.

Did you use the ESC/P2 control codes? They are very different from the
ECP/P control codes used by 9-needle-printers. The newer Epson printers
are no longer "Epson-compatible" at all :-(.

Hmmm... I started testing PCL3C commands from the A8 to my Xerox XJ6C inkjet
printer and managed to do a few things, but then didn't have time for more
complicated tests. But if you know the PCL3 codes, you can use them from the
8-bit.

I don't want to seem difficult, but that's a terribly ambiguous
statement in a rather anonymous posting. <g>

I am genuinely curious. Do you anticipate tangible future income from
this interest? Is there some unrecognized technology that lies
dormant with these assorted bits of historical software that holds
value in them beyond curiosity and nostalgia's sake? I'd really like
to understand. I've been writing software and designing hardware for
25 years now and I just don't hold any attachment to my prior works.
(maybe because I always looked back with the understanding of how much
better I could do it over again.)

All this stuff was great and worth every penny in it's day. Now it's
more of a curiosity than anything else. If I want to revisit the
mysteries of Action! and close a lingering gestalt, what does it
matter when the product is no longer commercially available and no
effort is underway to make it so?

>I agree that it would be really great if we knew who actually had the rights
>to the 8-bit stuff and what their attitudes were.

Maybe it'd smoke more of 'em out if people weren't so cautious. :-)

I do enjoy the dialog and these fascinating old 8-bitters...

Your best success will likely be to use the APE printing facility and use the available Atari fonts. Most everything will print out very well. This is about as good as it gets.
APE url: http://www.atarimax.com/

The url for the fonts:
fontshttp://www2.bitstream.net/~marksim/atarimac/fonts.html

Please prove this vested interest, either you own copyright or not. As
someone else points out you are posting anon (which breaks some ISP's
T&C) so you could be a 15yr old kid messing people around.

So please either identify both yourself and your ownership or stop
telling people what to post or not.

Copyrights are useless if the copyright holder does not actively prosecute those who the holder feels are infringing upon the copyright.

Since this has probably never happened regarding Atari hardware or software, much less in the past 5-10 years, I wouldn't worry too much about it.

Even if someone was particularly offended, I don't see them suing over something that they haven't made any money on in 15 years.

Also, E-bay seems to be being brought up a lot in this. Selling stuff on E-bay doesn't infringe upon any copyrights whatsoever.

Source record: 30314

Hi

I have an Atari 800XL and intend to use the SIO2PC cable to connect to my PC so I can use software like Atari810 to use my PC's hard disks with my Atari.

But how do I connect the monitor?

The 800XL doesn't seem to have an output for a monitor, so I am wondering if I can use the video in on my ATI rage pro 128 graphics card instead.

Has anyone got round this problem? I would love to have to 800XL sitting proudly with my 1.4Ghz Athlon PC !!

Thanks for your help in advance.

Graham

Copyrights are useless if the copyright holder does not actively
prosecute those who the holder feels are infringing upon the copyright.
Since this has probably never happened regarding Atari hardware or
software, much less in the past 5-10 years, I wouldn't worry too much
about it.
Even if someone was particularly offended, I don't see them suing over
something that they haven't made any money on in 15 years.
Also, E-bay seems to be being brought up a lot in this. Selling stuff on
E-bay doesn't infringe upon any copyrights whatsoever.

the above statement is not true as far as the copyrights are concerned,
just in the last 2 years i have had to warn a few people who were about
to infringe on a copyright that i hold.
i would have let them use it if they had asked, but they told me in no
uncertain terms that i was not the holder.
so i had to start to get together my paperwork, as well as the
uncompiled source, and i was prepared to file suit.
they backed down, and i have no hard feelings, i just wanted to be
consulted on anything that was done.
so there is still something to some of these rights.
now most do not care, and that is what i have found out, but some do.
BTY bob puff, and a few others here are owed money for work done on FTE
stuff, so they might jump on you if you are perceived to be making money
off of FTE stuff.
some who are owed money watch this nsg like a hawk, and are prepared to
pounce, so that is why i say be careful.
you do not want to have to travel to the state where the suit is filed,
if you think that you do not have to show just watch what a judge can do
to a no show when it comes to copyright infringment.

Nope, it ended with no buyer:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1339637365

This guy has a few OSS things, but he's way overpriced in my opinion. A
while ago he had a Newell 256K memory upgrade and Omnimon for the 800,
but no one bought those either.

I would like to have the Personal Pascal from OSS, but I can't afford
the $149 asking price.

Are you at liberty to say what Bob Puff is owed money by FTE for? I can
think of several people off hand like Newel or ICD that may have a claim,
but for the life of me I can't think of a single thing that Bob Puff did for
FTE.

1899. Atari 400 UK : TV Output Frequency Changing ?

Hi,

Does anybody know if its possible to change the channel that a UK 400
outputs its TV signal at. I've tried the switch on the back of the box and
it does nothing. With just the Atari plugged into the TV I get a picture on
at 588Mhz however if I also plug the nornal arial cable in I just end up
seeing white noise !!! I've also got a 65XE and that seems fine.

You could trim the cores in the modulator, I'm sure one of them sets
the output freq. Means a strip down but it *might* sort the problem..

Maybe

You know, the copyright issues are more clear with respect to programs for older computers than with respect to the subject of another newsgroup that I belong to.

An OSS or ICD program can be identified immediately by just about any hobbyist in the group, even if it's been cracked, and even if that crack was done twenty years ago. In that other group, files are posted that have been enhanced. It may be impossible for the person that enhanced the file to know that the file was originally a commercial file because that information is easily removed in that format, and then the file without the information passed around the Internet as if it were in the public domain. Proving that the poster knowingly altered and distributed a copyrighted work is very difficult, since the poster himself doesn't know half the time. In addition, in that other area, there are agencies formed for the protection of intellectual property that might jump in even when the original file was released with no copyright statement attached.

What's even more difficult is knowing whether all the members of a newsgroup can be in hot water if somebody posts a commercial work. If the copyright holder wishes to sue, he has to be able to show how widely the work was distributed. Who are the members of a newsgroup and how many are there at any given time? How many lurk and never post? How many people outside of the group can they pass the material to? It gets very hairy there, and those are questions that apply to programs for Atari 8-bits as well as the files I mentioned with respect to that other group. Ask two lawyers and you will get AT LEAST three opinions.

You say, be careful. I agree. Among the lurkers might be the copyright-holders themselves. Sure, there's no profit motive any more, but there's always a person's belief in principle.

Take care.

Alan

I do want the guy who is selling these to not do it. He's not doing
any favors and I'm quite sure is only interested in making money for
himself. He contributed absolutely nothing to create the CD, and he's
advertising it by e-mailing ads - and we all know how much we all
enjoy receiving unsolicited ads in e-mail!

The programs are not hard to find, making a CD with them is a trivial
task, and the guy does not deserve to make $20 or more off every
order.

> used these before)

We've only just started, but check out http://www.spalp.org . Right now, we're concentrating on straight CPU assembly language tutorials, but eventually we'd like to provide platform specific tutorials also. We do have a partial 6502 book... but the 68k will fall to me to write, and I need to finish up a few others first. The other two guys who I'm putting this site together with, are big Atari freaks, so expect those to be among the first to be completed. Then again, I do have 5 or 6 atari's myself...

If anyone wants free tutorials for other wierder cpus, they're going to have to donate some books. Not easy to find, even on ebay or amazon.

Thanks,
John

Yes, this is how I did it with my ATI All-In-Wonder card. You can run it either
in a window or full screen. I used this until I picked up a Commodore 1702
monitor.

Hello,
I am a ZX Spectrum freak, I want some emulator for atari800xl sound chip for windows. I have such emulators for ZX Spectrum, C64 and Atari ST.
Please tell me where to download such emulator and where to download musics for it.
Thank you.

You need a switch box so that either the Atari or the aerial is connected to
the TV,
not both at the same time.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

1914. Re: I got this in my email -- Nostalgia CD

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-25 10:53:37 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3C9F01B1.E6F92D9C@students.uni-mainz.de>
Source record: 30335

Ok,
actually I was talking of my own idea. At the moment I am planning to
release a Cd with some Pd Atari stuff I collected over the years.
Alltogether these are approx. 1000 images (not as big as the Pooldisk
Too). And the problem is just like I described it in the example: I have
some 20-30 selfmade/selfcreated images (mostly graphic and music stuff
that I converted for the little A8). I can just sell these and leave the
CD quite empty or fill the whole CD with other PD stuff. Well, of course
I will fill the whole CD, but I am gonna sell it for a low price (maybe
5 euros, maybe less) to those who are interested. Thus, you are not on
that list, hehehe... -Andreas.

Source record: 30336

Well,
there is some small commercial software on the Pooldisk Too.
Take a look at the subdir "Belgium", you will find pirate copies of
Zybex, Mr. Robot, Cavelord, Fatum, Spelunker, and a few other games.
This happened, since most of the ATR images in that directory are
bootdisks (and probably Bo and Ernest did not test every image). But
overall there are less than 20 pirate copies, thus the CD is worthless
for pirates or for collectors of pirated stuff.
-Andreas.

P.S.: the commercial software in the Subdir ANG was placed there with
the exclusive right from the former ANG guys and must not be copied onto
any other media (an info text says so...)

Hi this drive, the head appears to be trying to move forward or back, making a beep every 7 secs or so, but failing to boot....

Any one has knoweldge to help me diagnose the problem?

1921. CHIPMUNK RULES!!!

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-26 01:51:36 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <tjQn8.2902$Q7.338940@e3500-atl1.usenetserver.com>
Source record: 30342

Okay, so the happy drive doesn't work, but I got my brand new chipmunk and this has got to be the most complete list of commercial software I've seen compiled on the parameters disk!

Anyway, the good news is that this makes DEPROTECTED backups of virtually any Atari 8-bit software! I tried it out with the Datasoft basic compiler and it worked!

If anyone out there has original commericial protected Atari 8-bit software you would like copied and backup up in a deprotected form so it can easily be distributed in a .ATR or .DCM image just send me an email.

Let's try to preserve as much of the Atari 8-bit library as we possibly can. I've got quite a collection so far, and now with chipmunk I'm going to work hard on deprotecting all I've got so it can be archived on my PC hard drive and eventually burned on a CD-ROM for all time!!!!!

I've still got Alternate Reailty sealed and Hitchiker's guide sealed both of which can be deprotected with chipmunk. Maybe it's time to break em open, unless I can contact the current winner of the Alternate Reality mint disks and show him how to go about making deprotected backups.

1922. Were are old disk drives?

Panasonic RP-966 outboard Dolby B unit
RCA 64A theatre speaker
RCA oscillator/tester
*Dynaco FM-3 tubed tuner
*AR 2ax speakers

Plus Stereophile back issues, used blank reel tapes and even some factory prerecorded reels!

1925. Question about locations $C000 - $C007

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-26 14:44:21 UTC
From: Dennis Debro <dnsdebro@netzero.net>
Message-ID: <YF%n8.11796$Q7.2791658@e3500-atl1.usenetserver.com>
Source record: 30346

I posted this on the AtariAge message board and I thought I'd ask the question here too.

Here's the deal. In the 5200 Tempest disassembly Keithen Hayenga is setting $C000 - $C007 to #$00 every time he clears the P/M Graphics pages. I originally thought this was put in to crash the 8-bit but I'm not really sure about this.

I know locations $C000 and $C001 hold a check sum (LSB/MSB) for ROM bytes on the XL/XE but what about the 400/800? These locations aren't used right? I so then what purpose would it serve to set these locations to #$00?

I have a copy also. Nice progam. I usualy use it to make 2 back up copies. 1 for use, one just incase the original disk fianaly goes kaput.

I do appricate the irony that tools that may have hurt my access to games because of Piracy when the Atari was new/current, has become a good way that i can continue to enjoy those same games many years later and preserve them to some degree.

1928. WriteAtr V0.92 available

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-26 15:48:04 UTC
From: usenet-20020326@hias.horus.com
Message-ID: <slrnaa15vk.15c.usenet-20020326@camel.hias.horus.com>
Source record: 30249

Finally, I've uploaded version 0.92 of WriteAtr to my homepage
http://www.horus.com/~hias/atari/

The major changes between V0.91 and V0.92 are:

* Support for higher capacity formats (360k/720k/1.44M) is working now.

* High capacity formats are supported in three different mappings:
- ATR8000 compatible (used by most Atari high capacity drives):
first side 1 is written, then side 2.
- 'PC style' (eg Karin Maxi): starts with track 0 / side 1, then
track 0 / side 2, then track 1 / side 1, ...
- XF551: first side 1 is written, then side 2 in reverse order

* Written sectors are now verified by default, so you can detect
bad floppy disks.

* Whenever an error occurs, the exact position and error code is
reported and the user may chose to abort/rety/ignore the current
operation.

* I've fixed several smaller bugs in the disk-access layer (mainly
concerning the high capacity formats) and added some more
debugging info.

If you've been using an earlier version of WriteAtr, please upgrade
to the current version. Especially the 'verify writes' feature can
save you from a lot of troubles with bad media.

so long,

Hias

1929. Basic listing protection

Newsgroup: comp.sys.atari.8bit

> Qmeg?

No. The BASIC idea (pun intended) of this protection is to adjust the line
offset from one line to the next line to zero such that the interpreter loops
forever when looking for line 32768 (the "direct input") line.

> I've tried CHKBAS program, but it cannot set correct labels of variables. It

> Help me, please. Thanks in advance!

I might have an "untokenizer" for Atari Basic just for that. It decodes
the basic tokens manually...

So long,
Thomas

Disregard this message. It was answered on the AtariAge message board.

I forgot that the GTIA is mapped to $C000 on the 5200. Doh.

There are many, many, many. :)

Just search google.com for "atari xl demo"

You can also check out the collection of demos at various Atari FTP sites by searching for 'demo' at XL Search:

http://xlsearch.atari.org/

Obviously, I'm not a PC guy since I can't even set up Outlook Express
properly. I changed ISPs and couldn't get the newsgroups until recently and
I must have been using this identity as some kind of test or something.
Anyway, now I seem to be able to use this newsgroup - all I need to do is
fix my PC. I am going to build another PC with W2K so I'll fix the identity
thing to say AtariBob (Bob Woolley, not Bob Puff). (IS it improper not to
use my name?)

See, you do something dumb and the whole thread gets sidetracked. These
copyrights may have some future value or they may not. The point is that
there are people out there that may object when they encounter a violation.
I will, but I don't spend resources searching for "evil-doers". I don't
necessarily need to prove copyright ownership to have a vested interest in
something - maybe I'm negotiating to buy it, or have an exclusive license.
To sue, maybe - I dunno.

ahhhh, to be 15 again.... heck, 30 even!

Source record: 30259

Hello Everyone,

I have a problem with my 800XL. It will work for hours on end, and then "pow" it stops working. If I try rebooting (no disk activity either) all I see is a black video screen (and again, and again). I have to wait for quite a while before it starts working again. Does anyone have any suggestions as to what to look for or any on-line references that could help?

Thank you,

Fred

That sounds like the guy (Mike hohman?) who started fine tooned engineering, bought up the righrs to the icd and newell stuff. Well to make a long storey short he went bust and dissapeared in late 1995 without filling some orders and hadn't fully paid Wes Newell apparently. As for orders not being filled I can attest to this personally since I never got my r-time 8 cartridge, and a couple friends local to me never got their orders filled either.

I can agree with this. it does make it a bit harder for those who do sell some 8bit stuff as a sideline. The other problem that I thought of is, if a developer releases something as public domain or shareware, how can we verify it?

Most 'unlistable' programs I've seen have wiped variable name table.
(That's why my chkbas program doesn't display 'correct' ids).

The thing you describe I don't understand. Line looks like this:

WORD lineno BYTE linelen BYTE cmdlen... cmd (until cmdlen) another cmd
until linelen

Which byte you change and to which value?

The pointer to 32768 is directly in header so there's no problem in
finding that.

> Wasn't there a special XIO command for this ? I remember using XIO
> 254,0,0,"D1:" or something like that to format from basic (using DOS 2.5).

No, just because the concept behind XIO is quite something different.
XIO just sends a special command to the handler, but for a directory listing,
you would also have to display the results of the handler somehow... (-;
Well, that's beyond the scope of XIO.

A good solution concerning Atari BASIC is to put a special text file into
a fixed location on disk, i.e. on "D:DIR". Something in the spirits of:

```
DIM DIR$(20):O.#5,6,0,"D:*.*":FOR I=1 TO 0:INP.#5,A$:?A$:NEXT I
```

and then to use

```
ENTER "D:DIR"
```

to list the directory which would just execute the above line in "direct mode"
of basic.

Greetings,
Thomas

Hello there Bob, had I seen your name i'd have smiled and said no more
:-)

Btw, yes, posting via a deliberately screwed email can be viewed as a
non-no by some ISP's although it's rarely enforced.

>See, you do something dumb and the whole thread gets sidetracked. These
>copyrights may have some future value or they may not. The point is that
>there are people out there that may object when they encounter a violation.

Of course there will be and 99% of people who are contacted by a valid
source will remove said items from web pages, on sale etc etc but
until you 'de-cloaked' you might have been a 10-yr old messing around.

(although that's not exactly answering the point)

>I will, but I don't spend resources searching for "evil-doers". I don't
>necessarily need to prove copyright ownership to have a vested interest in
>something - maybe I'm negotiating to buy it, or have an exclusive license.
>To sue, maybe - I dunno.

Like I said Bob, 99.9% of people would respect a call for removal of
an item being distributed via pages or sold commercially without
permission but where I wonder is when people buy rights for an item
just so they can sit on an item and have no plans for releasing said
item ever. Sure, it's their right and I'm sure people would respect
their wishes but it seems such a shame to own a product just for the
sake of hoarding it for no real gain?

Source record: 30267

Howdy folks

I've stumbled onto a problem while trying to debug CD Audio Player (CDAP).

CDAP is getting so close to the ASPI manager in memory, that TurboBASIC overwrites part of the manager. How do I protect the manager if I can not change the location or format of the manager.

(I just sent Matthias a message to ask him if it is possible to relocate the manager)

I could stuff the ML code into a BASIC string, but I want to use the manager as is and no create a version that is 'BASIC only'.

I looked into declaring a string around the manager (from $8000 to $8800), but (Turbo)BASIC keeps moving these string in memory.

Please help.

Howdy folks

Am I the only one who'ld like TurboBASIC to be able to [TRACE] to (ram)disk
or printer instead of the screen, where it screws up you display?

Dry joint somewhere? Cracked wire? sounds like it

when it happens again, pop the case and see if there are any 'unusualy' warm
bits on the board.

Where? maybe someone else will have an idea.

Check out this URL:

http://www.icd.com/bargains/

OTOH, I seem to recall reading somewhere that ICD wasn't the most
reliable at filling orders these days, so you may want to do some
checking on that. Then too, at $7.95 plus shipping, it's not all THAT
great a risk.

You have to give it an inactive IO channel as in:
XIO 254, #1,0,0,"D1:"

There were some minor variations for special functions in Dos 2.5, MyDos and SpartaDos.

When I use to repair the Atari for a living I would run this test

```
10 PRINT "Hello ";
20 GOTO 10
```

If the 600XL, 800XL, or 1200XL would stop working 99% of the time the CPU sally "modified 6502" was at fault. To confirm this run the XL machine till it crashes and swap out the CPU, or use component cooler to cool the CPU down. Now here is the ironic thing, that same CPU will most likely work flawlessly in another XL machine. I would run this test for at least 48 hours before I would release the XL machine back to the customer.

You have one possible option in addition to relocate ASPI or condense CDAP, assuming TB uses memory similar to Atari Basic. TBasic starts with MEMLO at $3629 and builds the statement table up from there followed by string array space and runtime stacks.

Where is RAMTOP and the display RAM, and what is FRE(0)? You may be able to allocate your DIMmensioned resources creatively to near $8000 and then DIM a never used dummy string a little over 2K to get past $8800 and then allow TB to have what is available up to the display list.

Or it might be as simple as Poke RUNSTK (142-143) and MEMTOP (144-145) to $8801 *if* your strings all fit below $8000 and there is enough room above $8800 and below the display list. This Poke must be *after* any edit of Basic statements and *after* DIM of all strings/arrays. It must also be under program control and before any Gosub or For/Next statement.

The 2K dummy string method is safer, and should not be affected by Dos configuration differences if using TBasic. Any direct manipulation of memory usage apart from RAMTOP and MEMLO needs very detailed oriented planning and presents hazards.

Basic does move string data as needed, but *only* when the program size changes as code is added or deleted. Shifts are normally small when "RUN" replaces "SAVE "D9:ASPI>TBASIC>TEST4.BAS" as immediate mode line number 32768 in the statement table

1959. Re: How to print Basic source?

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-27 23:44:25 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <tPso8.1329$n83.102662@newsread1.prod.itd.earthlink.net>
Source record: 30280

Does your printer have an escape code command or DIP switch to configure
7-bit pure ascii mode? This would convert inverse characters to normal, but
leaves you susceptible to control characters in the zero to 31 ascii range
which sometimes do form feed or other distractions.

Another option is save the program in LISTed form with:
LIST"D:MYPROG.LST" and send it manually to the printer with a lister routine
to mask out the offending characters.

```
10 OPEN #1,4,0,"D:MYPROG.LST"
20 OPEN #2,8,0,"P:
30 TRAP 80: GET #1,B
40 IF B=155 THEN PRINT #2: GOTO 30
50 IF B>159 THEN PRINT #2;CHR$(B-128);:GOTO 30
60 IF B<32 OR B>126 THEN PRINT #2;"&";:GOTO 30
70 PRINT #2;CHR$(B);:GOTO 30
80 END
```

Take note of the semicolons in lines 50, 60, 70 to suppress line feeds. You
could choose your own substitute character in line 60 and also reject or
accept other specific characters.

I recently picked up a Atari Writer System package at a thrift store, everything looks new and unused (still sealed) except the computer and PS.

The problem is that when the 600 is switched on all I get is a ugly green screen with diagonal lines running down the left third of the screen.

Anyone know what might be wrong? Any help would be appreaciated.

>
```

Oops, yes... I took them down the other night. I loaded up some more stuff on my server space, and removed them just in case I needed the room (the 5 pics take up almost a meg in space). I just FTP'ed in, and am only at 57% of quota, so they're back up.

I figured the thread was old by now and didn't realize people were still checking out the images. As a sidenote, and a gripe against Earthlink... Mindspring used to have some Web space statistics that used to show how many hits and views that each file on your server space received. Earthlink (which bought Mindspring quite a while ago) finally did away with that statistics page, replacing it with their own "Urchin" statistics page. Although these statistics are "prettier" and show you some charts and graphs, it does not show you hit counts for images, just HTM files. So, now I have no way of knowing if my images are still being viewed (I used to REALLY like using that to catch Ebay picture stealers).

Anyways, the images are back up. Sorry!

Agh! Why geocities instead of tripod? I'm in the process of *leaving* geocities, beginning april they'll no longer support FTP for up/downloads, and you won't be able to access your e-mail via POP anymore or even forward it elsewhere... And currently, they have that annoyance of checking downloads on a per hour basis and blocking your page if you have exceeded a given amount (soemthing like downloading 1MB in 3 minutes or so...)

IIRC, you'd to set the linelen to zero for the last line of the program
such that the interpreter loops forever finding line 32768.

> The pointer to 32768 is directly in header so there's no problem in
> finding that.

Not the way how ATARI BASIC handles it, though.

So long,

Leave it on the green screen over night. Sometimes the heat and juice will
revive an ailing Atari.

If that fails I would bet RAM. On coldstart the CPU does a jump to ROM and
it looks like it is getting as far as some prelimary graphics chip set up.
That you even have a green screen means your clock circuit, GTIA, and ANTIC
are probably OK. You can boot an Atari with the PIA chip pulled, so that
kind of corners it to RAM or moisture/oxidation of contacts.

My 800XL, after sitting in the cupboard for 8 years, fails self test, about 10 red blocks coming up.

Anyone know how to trace where the problem is? Memory controller or DRAM chips (4164s). The problem is always the same blocks, so at least its consistent! Is there a way of disabling the self test so that i can at least use the cartridges for now? Where can i get good DRAM devices from (in am in UK).

Many thanks for any help.

Neil

1970. David Crane ?!?

David Crane, the author of Pitfall and other great games, can be
found at Skyworks these days:

http://www.skyworks.com/about/about_principals_david.htm

David Crane with connections to "Friends" is not the same person:

Most likely the DRAM vs memory controller. It is pretty much generic 64kx1
DRAM chips of 150 ns speed. You should be able to find those in older memory
cards for the PC or such things as printer buffers. If worse comes to worse,
the 256kx1 DRAMS will plug right in and function as 64k chips w/o any
modification.

I was checking www.vg-network.com and saw this about the new Atari 800 Win 3.0+ :

supports 22 types of cartridges (e.g. SpartaDOS, DiamondOS, XEGS, Action!, BASIC XL), allows running BBS software thanks to R: device emulation, can read cassette images (CAS) as well as raw files using emulated tape player, makes a DirectSound driver available to music lovers, allows saving video with sound track to an AVI file, can emulate Atari trak ball, helps a lot in a game cheating, allows booting any Atari software using one keystroke, fully emulates second button of an Atari 5200 joystick.

Now the question is how to dump these carts like basic XL? I have the latest version 1.03 ... anyone can help with this?

The Trace_output comes from a normal print command (output at IOCB #0). If it was #6, you could close #6 and open #6 for printer output, but it isn't. So, there's no way to TRACE to printer or ...

CHKBAS has to create new variables names, because the old names are deleted.
One method is to create a wrong var-table by using the same var-name for all
var's, another is to replace all var-names with return-char's (CHR$(155))...

exsamples:
original listing

```
LIST
10 DIM A$(20),B$(20)
20 C=15
30 A$="Hallo":B$="World"
40 ?A$:?B$
RUN
Hallo
World
```

replaced by same var-names

```
LIST
10 DIM A$(20),A$(20)
20 A=15
30 A$="Hallo":A$="World"
RUN
Hallo
World
```

replaced by return's

```
LIST
10 DIM
(20),
(20)
20
=15
30
="Hallo":
="World"
RUN
Hallo
World
```

The real last line *is* 32768 in the SAVEd file; the POKE(PEEK(138)+...
method changes length of previous line to zero. Basic then cannot find last
line and end of statement table resulting in a trip to never-return land.

You could POKE the put byte address from printer or any device into IOCB
zero to redirect output. You still get your display data mixed in going to
the alternate device; do not know any way to separate them...

I sell well-tested Ataris at auction. What do you have to say about me?

"Well, regarding Auctions, the Wise Saying should read "You Don't Get what You've OverPaid For!" or "Theirs a Sucker Born Every Minute" (http://home.pacifier.com/~atari/auctions.htm)

That's why I take my business to someone who respects our small community and doesn't denigrate members for personal profit: B&C ComputerVisions: www.myatari.com

p.s. Here's a freebie, you dope: it's "there's", not "Theirs"

p.p.s. Lose any e-mail addresses lately?

Source record: 30156

Hi I need to dump a Basic XL 1.02 cart for someone far away.

He gave me the dumped 1.03 cart which I own, but I don't have the SIO2PC cable and all that to make it possible for me to dump the version 1.02 that I also have. I can send you the 1.02 cart, you can dump it and then send it back to me. You'll also be able to use it with the new version 3.0 of Atari 800 win+ which is way cool.

Please let me know.

You might be able to swap memory chips around to get the good ones in a
single block at the bottom of RAM and have enough to execute some carts.
Sort of making the 800XL into a 600XL...

I did a re-LISTer program for someone in Alaska a year or so back; all in
Basic with just OPEN, GET, NOTE, POINT and PUT.

It corrects that last line offset and provides the option to generate a
variable name table. Arbitrary labels like A$, BB(or VAR01 are all you can
do whenever the originals were replaced with 'Return' or 'Clear screen'
characters. The cosmetic fix is:
1) Load your unprotected Basic file
2) LIST it to an atascii text file
3) load this file into a text processor
4) search for variables and
5) replace generics with descriptive labels
6) save this updated file
7) ENTER it into Basic and
8) SAVE it as completed corrected file.

Hm. It seems, the question "what happened to the whole a.b.c.*
hierarchy?" would be more appropriate :-(. Some other groups from the
alt hierarchy are no longer available on the news server of my provider,
too (ok, they had a crash in january).

I never could see anything in the binaries group(s).
Right now, I can see the group, but it only has three messages.
Seems like I remember it gets cleared out about every day or something.
I would have to go to dejanews if I was looking for something.
Between spudster and Aaron Wheeler, that's where I usually look
for stuff.

Son.
As far as I know, the only way to dump BXL is with Omnimon
or similar ml monitor. You have to poke values into $D??? and
then dump $B000-$BFFF. And you also need to dump
$A000-$AFFF. I think this is how the bank switching super
carts work. I have a dump I did of BXE this way. There are
three banks at $B000-$BFFF, which are selected with the
$D??? switch. That makes these 16K carts. I think Gato
is a 128k cart, so some more bank switching is done with it.
Russg
Here's the dump info I got from Jason Duerstock....
From Jason Duerstock.
RTime 8 uses addresses d5b8 and d5b9.

d1e2 & d1e0 are high & low bytes of the page # of the MIO
RAM that gets mapped into the d6xx area for serial, parallel
and SCSI ports of the MIO.

To dump BXE and ACTION!, any access to d500, d501 or d509
selects the bank of the cart that goes in a000 to afff.
ie. bits 0 and 3 of d5xx do the select. b000 to bfff remains
constant. afff will show a 0, 1 or 9 depending which bank is
active (d500, d501 or d509).

BXL and Mac65 use d500, d503 and d507.

MIO control address = d1ff. 4, 8, 16, 32 value here banks
the ROM in the MIO to d800-dfff.

For SpartaDOS X, any access to d5e0 will toggle SpX on or
off.

2003. Anyone have a busted 1050 or 810? Looking for chip

Newsgroup: comp.sys.atari.8bit
Date: 2002-03-31 00:23:31 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3ca6570a$0$1412$1dc6e903@news.corecomm.net>
Source record: 30174

I plugged a wd2793 floppy controller chip into a 1050 backwards.
This blew the chip. I think the 1050 is functional otherwise.
(I was looking at it and said 'that's backwards', but plugged it
in anyway. Who knows, I've been doing too much disk drive
stuff.)
So if someone has a 2793, or maybe even a 2797, I'd purchase
it from you. Otherwise, this 1050 is good for parts.
(I'm still working on my Indus drives. About my last hope is
a sn75437ane stepper motor control chip. I ordered two.
As for ordering a wd2793, I found places that had them with
a $500 minimum order.)

Once you know which and where and how the banks appear, you can:

POKE some machine code in page 6,
OPEN a CIO channel for disk write and
USR(1536) where your code can:

save original $D??? for later
toggle $D??? for the correct bank
copy the code to RAM around $7000 and
dump it to disk file
repeat 2 more times for other banks
reset $D??? to original setting
RTS to Basic X?
CLOSE IO channel.

The ML code can be quickly cobbled together...
PLA
LDA $D???
STA safeplace
LDA #bank1
STA $D???
JSR move and dump
LDA #bank2
etc...
LDA safeplace
STA $D???
RTS

Message-ID: <QqBp8.23242$Ko1.4237429@news6-win.server.ntlworld.com>
Source record: 30177

I'm working on a project to develop an IC tester (logic and memory). The first phase of the design will be to develop the decoding circuitry on one of my XL machines before miniaturising it and installing it into a stand alone system with a microcontroller (if there's any call for a low-cost IC tester for the Atari then it may be possible to release it and the software commercially)

The decoding circuitry will connect up to the joystick ports and the 8-bit used in place of the eventual microcontroller. The only thing is that I can't remember how to turn the joystick ports to outputs. Any pointers?

David

2007. Seeking for "Halcyon Days"

Newsgroup: comp.sys.atari.8bit

Thanks, Brett.
They have all the chips I was looking for, the hard to find ones for the Indus, the MC3470, the SN75437 and the 2793.
I shoulda asked here before I bought elsewhere. All of them are cheaper than I paid too.
Now my problem is a minimum order. I'll have to check it out.
Russg

Source record: 30180

OK. That'd probably work (ml program to dump OSS carts).
I'm not sure you could easily put it on page 6, but that's not
necessary, you could put it anywhere, like $3000.
The difference with the language carts from game carts is
that you can access DOS from them and run your ml program.
And now you mention it, such a program could be used to
dump any cart using Omnimon's Get File command then
Jump subroutine to the address of your dumper ml program.
I was thinking that BXL and other language carts may be doing
bank switching when you try to dump from a ml program.
I don't know when the carts do their bank switching.

The manual has the memory upgrade. Real easy. (As has already been said)

The drive case is not hard either..many surplus electronics places will have them in different sizes. Some with power supplies. I built mine, and used a spare pc power supply for the drives and for my XL computer.

Rick D.

There are programs around to do just that..list basic programs in plain text. LISTER.BAS is a generic name. Some print in all graphics, and some will print plain text except for special stuff that prints in graphics. Depends on your printer.

Make sure the board and the OV256 chip are in the right direction. I can reburn
the chip is needed. I can also test the board.

OV256, OM XL, and OM800 are different OS chips. The 800 version will not work
with the XL/XE version of ramrod, at least if its the 4K rom version.

Looks are deceiving..its a special switch, dp 3 way binary

This is why I don't use trace. Its just not useable unles it goes to a file or printer. Or the app uses a split screen.

I just put in print statements instead(usually to line 23 ending in semicolon).

Good places are:

thrift stores..my Goodwill has a computer center. I can find 360K and 1 meg drives for the ATR.

Also, Computer surplus centers are good. And catalogs usually have 360K and 1 meg new drives two.

The ATR can use 3.5" drives, but I find the second disk type to keep up with not worth the effort.

If I can find my copy.

David

2020. Re: Omnimon questions

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-01 01:42:49 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3CA7BB19.37728B1A@one.net>
Source record: 30191

With Kevin's help I was able to get it working. This particular 800XL
also has the Newell 256 memory upgrade. I've done the "130XE compatible"
mod to the Newell and the next thing on the list is the Super Video mod.

The computer is a bit flaky when booting sometimes. Every once in a
while it won't boot at all. But, if I leave it off for about 30 seconds
or so, it will boot fine.

Isn't there a mod to drain the extra memory faster?

2021. Guy has FA on Ebay Atari 400/800 Carts TOPPER, PENGO, More, Atari 2600 MUSIC MACHINE, TI-99 M*A*S*H, Other Rare Cartridges!

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-01 07:09:24 UTC

I won't be able to afford these 'cause I'm currently unemployed, but I
enjoy helping others when I can. While looknig around Ebay just now,
I found this guy that must be selling off some of his lifetime
collection! Among other things, (Mostly rare Atari 2600 Stuff), I saw
cartridges for the Atari 8-bit computers like TOPPER, PENGO,
Activision's DESIGNER'S PENCIL, and STAR WARS: THE ARCADE GAME.
Here is the link to his main listings, (I think he has more than one
page of them):
http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=possum-glory@usa.com&incl
ude=0&since=-1&sort=2&rows=25
He also has a BRAND-NEW-LOOKING, COMPLETE FAIRCHILD CHANNEL F SYSTEM,
how often do you run across one of those in ANY condition?? Here is
the link to it:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1342975362&r=0&t=0&showTutorial=0&ed=10
17758001&indexURL=0&rd=1
I know Atari 2600 collectors been looking for the Atari 2600 SPARROW
MUSIC MACHINE cartridge in particular, so here is the link to that
one:
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1343123205&r=0&t=0&showTutorial=0&ed=10
17806326&indexURL=0&rd=1
And he had some Texas Instruments TI-99 4/A cartridges that I never
saw before, (or even knew existed), like M*A*S*H, MUNCHMOBILE, and
RETURN TO PIRATE'S ISLE.
I also saw many many other rare items he had that I wish I could get,
including some Commavid stuff, and rare items for several other
systems as well, many of which (mostly cartridges) are the only ones
of their kind on all of Ebay!
Best to hurry, though!
Some of his best auctions end in only a day or so!
He also appears to be adding MORE and different rare items to his
auctions right along, so it might be a good idea to keep checking back
every day or two in order to see what he's added.
Hope this helps some people who have been looking for this stuff, and
good luck!

2022. Midwest Classic Announcement

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-01 08:08:44 UTC
From: wgungfu@alpha2.csd.uwm.edu
Message-ID: <a894ic$70j$1@uwm.edu>
Source record: 30193

On June 30, 2001, the GOAT Store, LLC and Marty Goldberg teamed together to bring Atari Jaguar Festival to Milwaukee, and it was considered by many to be the best Jaguar Festival ever. This year, the GOAT Store, LLC and Marty Goldberg are getting back together to bring gamers the biggest classic gaming show of its type in the Midwest -- the Midwest Classic.

The Midwest Classic promises to offer visitors an incredible amount of things to see and do. From pinball, to video games, to classic computers, the Midwest Classic is shaping up to be a real classic event!

Pinball

Pinball was born in the Midwest, so it is only appropriate that the event will feature the classic ball and flipper game. Not one to settle with just being able to play pinball at the event, The Goat Store, LLC will be offering the chance to see how a pinball works from the inside!

The Video Games

One of the features to many classic gaming events is the ability to see, and play with, many rare systems and items, and the Midwest Classic will be no exception. Marty Goldberg's Classic Gaming Museum will be vastly expanded this year featuring everything from PONG to the machines currently on the market.

"At Atari Jaguar Festival 2001, Marty Goldberg's gaming collection proved to be one of the biggest attractions," stated Gary Heil of the GOAT Store, LLC. "This year, the Classic Gaming Museum will be larger and more comprehensive. We can't wait!"

The Classic Gaming Museum will feature nearly every video game system ever released in the United States, as well as seldom seen video game promotional materials fomr the 70's and 80's. The Midwest Classic will also feature many video game related tournaments which attendees will be encouraged to participate in during the day for lots of systems like the Atari 2600, Colecovision, Nintendo Entertainment System, Sega Genesis and more!

The Computers

As classic computer collectors know, sometimes there is nothing better than an old computer. The Midwest Classic will feature many classic personal computers from the first mid 70's microcomputers, to commercial computers and peripherals by Atari, Commodore, Apple, Tandy and more!

Revisit the ways computers began. Visitors are encouraged to see if they can remember what their favorite computer games were... and why attendees who don't still have them need to get their old computers back!

And Much Much More!

The GOAT Store, LLC and Marty Goldberg promise that there will be a lot more surprises in store for visitors to the Midwest Classic! Announcements about exclusive Midwest Classic editions of some homebrew games, special tournament prizes, and more will be coming in the next few weeks!

"The Midwest Classic is going to be a great event for anybody who wants to learn a little bit about both video gaming and computer gaming history, compete against new friends, trade games or just enjoy the day playing great games," stated Dan Loosen of the GOAT Store, LLC. "The Midwest Classic is going to be a true classic."

The Midwest Classic is scheduled for June 8, 2002. Tickets are currently on sale at the GOAT Store, LLC Web site (http://www.goatstore.com). If you would like to help with the show, or if you have any questions about it, feel free to email Dan Loosen (loosen@goatstore.com) or Gary Heil (heil@goatstore.com).

2023. PhillyClassic Update 4-1-02

Update 4-1-02

TABLE SPACE IS ALMOST GONE!!!

If you're planning to reserve a table for PhillyClassic you should do so soon! We have less than **5** remaining tables with 3 1/2 weeks left before the show!

PHILLYCLASSIC HOMEBREW GAME RELEASES

PhillyClassic3 is proud to announce the following PhillyClassic game debuts and/or exclusive show releases from some of the hardest working people in the game business - classic gaming developers!

Daniel Bienvenu will release his new ColecoVision game, Bejeweled. Details on this very cool project are available at http://www.geocities.com/newcoleco2/rom/games.html. Bejeweled will sell for $30.

Brian Prescott will be debuting Vault Assault Tournament Edition and bringing some other goodies along. Check here for info on his project: http://home.tampabay.rr.com/bprescot/vaultassault/index.htm

Christopher Tumber will be debuting Vectrex VIX/Tsunami and Spinnerama at the show and may be putting some other surprises together as well.

Joe Grand and Hozer Video Games proudly announce a PC3 edition of Joe's Atari 2600 game SCSIcide (50 limited edition carts with a special glossy laminated PC3 label). Here's the website for details: http://www.mindspring.com/~jgrand/atari/

Joe Cody of Atari2600.com tells us he will be releasing Atari 2600 Bugs Bunny at PhillyClassic3. In addition, he has a special guest who will be accompanying him at the show, Mr. Bob Polaro, programmer of Bugs Bunny as well as Defender, Sprint Master, Real Sports Volleyball, Desert Falcon, Road Runner and Rampage. Bob will be on hand to autograph copies of Bugs Bunny and meet with collectors.

Sooooooooooooo.... what are you waiting for? Buy your tickets online NOW and plan to join us for some awesome videogaming fun!

CORPORATE PC3 ATTENDEE

EBGameworld is on board!! Come down to the show and check out their spread! Check out their website at:

http://www.ebgameworld.com

TABLE SPACE IS GOING FAST!

If you're planning to reserve a table for PhillyClassic you should do so soon! We have less than **5** remaining tables with 3 1/2 weeks left before the show!

Also, anyone planning on coming should get their ticket orders in before the show. Tickets will only cost $10 pre-ordered but will be $15 at the door so order now and save some cash! :) Check the PhillyClassic website for order info:

http://www.phillyclassic.com

PHILLYCLASSIC TO GIVE AWAY 2 X-BOX AT THE SHOW!

That's right! We now have 2 consoles to award to some lucky gamers at the show! Head over to our website for details!

Now you HAVE to come down to the show! :)

Check out David Newman's interview with Armchair Empire!

http://www.armchairempire.com/Interviews/david-newman.htm

PhillyClassic is now deep into the planning stages. Here's the rundown:

* The dates, time and location are all set. PhillyClassic will happen April 26th and 27th, 2002 at the Valley Forge Convention Center in Valley Forge, PA. 15,000 square feet of gaming goodness! Doors open at 5:00 p.m. on Friday to the public and close around 10:30! :) Saturday morning we let the ticketholders in bright and early at 9:00 a.m. and play, play all day!! More scheduling to come soon at http://www.phillyclassic.com!

* Tickets and tables are now on sale and are going fast!! All payments can be made through PayPal to Phillyclassic3@yahoo.com, or visit the website for info on where to send checks and money orders. Tickets are $10.00 pre-ordered and $15.00 at the door.

Tables are priced at:

UNPOWERED TABLES:
1st table - $20
2nd table - $30
3rd and subsequent tables - $40

TABLES WITH POWER:
1st table - $30
2nd table - $40
3rd and subsequent tables - $50

VENDOR/CORPORATE TABLES:
$100 Unpowered/$150 with power

The reason the tables are priced differently this year for powered vs. unpowered is because this year we are being charged by the convention center for electrical needs.

The other difference in table pricing (the $20/$30/$40 progressive setup) will allow for the most possible people to get a single table and to put a fair price on tablespace for people who plan to move a LOT of goods.

* We also have Corporate space available and are talking to a few big companies about attending and getting out to the gamers like you directly!

* Tournament scheduling is almost complete. The console tournaments are as follows:
Friday night(Early Bird Tournament):
Nintendo64 Pokemon Puzzle League

Saturday:
Atari 2600 Warlords
Nintendo Burgertime
Sega Saturn Bust-A-Move

Our arcade tournaments will be announced shortly but it looks like we may actually be able to do a WHOPPING 7-8 tournaments instead of just 2 for them!

* We have given over 1/4 of our total space for - get ready - upright arcade games ON FREE PLAY!!! Wow!! If that arcade at your local mall is as disappointing to you as it is to us then make it a point to at least come down for this part of the show! You won't regret it!

* Like the more current systems as well? Fear not! We have not forsaken you! Many of us will be featuring Playstation2, X-Box and Gamecube along side our beloved Atari, Intellivision and ColecoVision systems!

* Join our Yahoo! mailing list to get updates directly as well as discuss the show with others and set up personal trades for the show! Join here: http://groups.yahoo.com/group/phillyclassic/

* Check in at our website at http://www.phillyclassic.com for late-breaking news, updates, accomodation recommendations, driving directions and more!

We look forward to seeing you at the greatest PhillyClassic yet!

> it from?

I have it in Mac format (floppy!). I really cannot recommend it. It would make an excellent web site (and in fact it is in HTML format, which makes the choice of delivery platform all the more odd) but I simply can't say that it's worth $25US. Some of the interviews are definitely interesting, but certainly nothing out of the ordinary. The articles are about 5 HTML pages each, so if this was in print it might fill 25-50 pages at the most. I doubt you would pay $25 for such a book.

Maury

Let it go.

2031. CD Audio player: small patch for those with a NEXT TRACK button

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-02 12:42:33 UTC
From: Mathy van Nisselroy <nisse-ma@reze-1.rz.rwth-aachen.de>
Message-ID: <a8c8vp$q2g$1@nets3.rz.RWTH-Aachen.DE>
Source record: 30202

```
Howdy folks

If you are using version 138 or 139 of CD Audio Player, please change the
following line:

27310 DASHONTRACK=CURRENTTRACK

to

27310 IF CURRENTTRACK<>= THEN DASHONTRACK=CURRENTTRACK

If you press the NEXT TRACK button on your CD-ROM, CD Audio Player will no
longer crash. When pressing the button, the current track will for a second
become zero. Since the routine I use to calculate where to place the dashes
on the screen doesn't like that (I guess a 'divide by zero' occures), it
used to bum out. Now the zero doesn't ever turn up in the calculation.

(or
> build one in) or expect the consumer to buy a separate one.

I'm using a MIO PBI adapter with my BlackBox, that way, I have a flexible connection between XE and BlackBox. So I can move the XE around a bit without damaging the Blackbox. Second advantage is that an adapter is easier to replace then a BlackBox. (there are times when I have to go from one XE to the next very often.)

Howdy folks

For those loving pictures of Atari meetings. Try http://www.abbuc.de click on AKTUELL, then Schreiersgruen, then 'Die ersten Bilder' and after that 'Ein weiteres Album'. I wasn't there but it seems to have been a nice meeting with lots of people. BTW AFLOS stands for Atari FLashROM OS. It's still under developement by MacFalkner.

All depends on how I manage to design the decoding and encoding logic
(working on a few possible designs at the moment).

An IC tester is simply a device that allows you to plug in a chip and it'll
run some tests on it to check that it's working properly. At the moment I'm
only concentrating on getting the basic design down for testing logic chips.
Once that's up and running, along with the software, I'll work on the second
model which will include the ability to test RAM chips.

Initially, the chips that will be tested are the 7400 and 4000 series CMOS
logic chips.

The design I'm aiming for is a generic unit that can be connected to any
computer with little modification (it'll make it easier for me to interface
to a microcontroller later).

A professional stand-alone IC tester costs up to and over US$1000. I've seen
some that will test several hundred different ICs. That's the ultimate aim
of this project.

Hello,

Yes, I do this all the time. I hook either my 800xl or my 130xe to my
17 inch VGA monitor. What you need are two things, one is a video
converter and then a Commodore monitor cable. You can get the monitor
cable from B&C and the video converter can be purchsed at a number of
places. I got mine from Matco.

Source record: 30212

I'm auctioning a fairly complete Atari 800 system on eBay.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2014037502

Due to a typographical error in the title that I didn't catch, the auction doesn't show up during a title search, so I think the auction price is going to be low. $14.50 right now. Someone who needs a system might as well take advantage of my mistake.

I also have Autoduel, Temple of Apshai and Flight Simulator II for auction. The lot is only $5.55 right now. All original disks, boxes and manuals, complete except for the warranty registration cards.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2014284617

I'm going to be listing a few more items over the next couple of days, including several games, an Atari Logo cart with manuals, an Atari printer, a few more systems (including an 800 XL with floppy), etc. Check under the seller ID double_bbl over the next week or so.

Please do not e-mail me at my listed account -- the mailbox is permanently hosed, which is good since I don't want to see the spam that always seems to follow a newsgroup posting. You can contact me via eBay.

2042. ANNOUNCING ARCHER MACLEANS WORLD KARATE CHAMPIONSHIP NOW ON CART

The closest I've found is in a 'revamp' of Mapping the Atari sold by the Tyne and Wear Atari User Group a few years ago. The book was called 'The Complete and Essential Map' and came in a two manual set. The first book was pretty much a copy of Mapping with some errors fixed and a little extra info in places. The second manual included extra information, including a documented XL/XE OS listing.

I have an Atari 810 happy drive that doesn't appear to work.

Can youi tell me how to remove the happy upgrade that might work in another drive?

thanks

2046. Im done with my efforts on Indus, for now

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-04 00:38:30 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3caba087$0$77322$1dc6e903@news.corecomm.net>
Source record: 30217

Here's a summary of my efforts with my 2 Indus drives, and my
others as well.
I'm done messing with my floppy drives. I have taken about
a month with all 8 of them.
The stepper control chip sn75347ane was the most significant
improvement for my Induses. However, the Induses are still
not what I'd call reliable. One is still worse than the
other. I tried turning the stepper motor slightly both
ways. This resulted in significantly worse reading of
sectors, so I put it back to where I marked it to start
with.

Without knowing exactly what some of the pots on the Indus
do, and how to set them, I can only try a little one way
then a little the other. For the read pot, R31, I counted
the full extent and then went 1/2 way. This seems as good
as any, slight movements both ways no improvement or worse.

I tried new chips for every socketed chip on the Indus
except the Z80 and ROM. I tried adjusting every pot. I
reduced the speed, with pot R12, I think to 285. I tried a
new mechanism. Only the stepper chip helped at all.

My Ranas are working about as good as they ever did.
My 1050s seem to be about as good as it gets as far as
reading, writing and formatting. I have US dblrs in three
of them.

I'd suggest anyone planning to do things with their drives
to use a sector reader and see how the disk reads. I used
SmartDOS 'T'est sectors. Disk Wizard II Map disk would also
work.

I have an Astra 2001 double drive unit. It never gave me any trouble.

It supposed to have direct drive motors and relaible circuitry built for BBS
owners.

Unlike the belt driven 810 and I don't know what the 1050 uses.

Source record: 30219

Right, the Astra. I think there is a lot to the design of drives.
If the Astra never gets errors, that's great.
You can tell when a drive has problems reading/writing sectors.
It will re-seek the sector, 'snark', like on copy protected disks.
Or it will make a 'pfhhht' sound, rather than the nice 'beep beep'.
I like the Atari disk sounds, you can tell what is going on just
by the sounds.
I think the design of the 1050s, and US dblr, is just a better design.
There were more than one drive mech and I think the electronics
were different in some Indus.
SmartDOS 't'est sectors is a good way to see that the drive reads
whatever sectors you pick.
If you just scopy (SpDOS) or disk copy an entire disk from
one drive to another, that's a good test of disk and drive.
On another note, REMOTE.COM, I think messed up real bad.
I ran it, with no APE cable attached (why do I do these things?).
I ended up with three REMOTE.COM files, two 0 bytes.
And another file that x32g.dos reported as about 197k, larger
than the disk. Time to erase trashed files, copy the good ones
over to a newly formated disk, and re-format the disk.

I don't have a quick answer.
It is my opinion that Happy, Archiver and other 'super' mods
cause problems. So perhaps saving the Happy isn't going to
work in a new 810, if the Happy is where the problem is.
All the speed stuff and enhanced abilities seem to me to
be the source of errors and drive failures.

I would seriously consider diagnosing that drive, it's hell on a drive to
get an upgrade like that - so you may wind up killing another drive.
Why don't you tell us what it's doing and maybe we can help?

I jumped into this thread late so I'm not sure it has been mentioned
but I am using something called the "Cheesebox" and I can switch between
the PC and Atari with just the touch of a button, perfect for SIO2PC.

From: swebb <swebb@swebby.screaming.net>
Message-ID: <3cacc7fe$1_3@mk-nntp-1.news.uk.worldonline.com>
Source record: 30226

Hi,

I posted a message about this a while ago but didn't get much of a reply. I've bought an atari 400 which works fine, however when i plug the ariel lead into the tv via a split with the normal ariel lead the 400's picture is replace by noise. If I do the same thing with a battered 65xl I have thats fine. Any idea's ? If its because the 400 is outputing at a frequency that clashes with a tv station is there an easy way of changing the 400s output a little.

Cheers

It sure was *great* seeing lots of people appreciating those venerable computers. Brings back good times during the 8-bit hey-days with sizeable groups at TACE meetings before it dwindled to a handfull and finally disbanded in spring 1996.

Does anyone know how i can transfer all of my old 51/2 floppys to the PC?
Is there a modification I can do to the 1050 diskdrive so the PC can read
it? or
Is there any software out there that can read atari 800 5 1/2 disks using a
standard (very old) PC 5 1/2 disk drive?

Hi there,

Well I'm not totally sure what you mean, the description of your connections is a little vague. Anyways, for most 8bit stiff the rf out on the computer goes to a switchbox (to switch from the computer to the normal antenna or cable), the switchbox then connect to the tv. There is also a connector in the box for the antenna (or cable). Is the type of setup your talking about? On the atari 8bits I've got there is a switch to switch between 2 different channels.

2061. Newell 256K and SpartaDOS question

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-05 05:43:47 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3CAD3993.E897E418@one.net>
Source record: 30231

I have an 800XL with the Newell 256K upgrade. I did the 130XE compatible mod to it.

When I boot with SpartaDOS X (4.21) it shows a ramdisk of 440 sectors. When I go to the FORMAT menu, the only thing I can do is change the volume name. I can't specify the mode.

This happens with the switch in either position. Did I screw up the mod?

-Bob

hi andre,
you mean the screen shots of all of the different cities aroud the
world that the championships are fought, if so yes, including the music,
and the sound effects.
this game was really the first head to head fighting game that has real
time joystick movements, it is a masterpiece, and i am lucky to have
gotton permissio.
sometimes i just plug the cart in, and let it play the music, and watch
all of the different world wide scenarios in demo, its awesome.
thanks,
lance

Well I use a Y connector. This allows the atari and the normal ariel lead to be connected at the same time. The theory being that you can switch channels on the tv and also switch to the channel the 400 is on. When using the 65xe this works fine, however with the 400 i just get noise, well not white noise but a a very corrupt screen. I suspect the 400 is outputting a signal at the same frequency as a local tv station, or a weak station I can't normally view anyway. So is there a simple way of adjusting the frequency the 400 outputs on ?

Atari's in the UK don't tend to use those switchboxes, or at least, I
have never seen one that does. Usually they are connected either
straight to the TV, or through a little box with 2 antenna inputs and
1 output (but with no switch).

If it is clashing with a TV station, then you should be able to tell
by connecting the 400 on its own, then disconnecting the 400 and
connecting the normal ariel on its own, seeing if you get a picture
with both.

This is a silly question, but are you sure that the split works? If
any of the connections on it are lose/broken then it might also cause
the problem.

If the PC is very old, maybe Anadisk will read those disks; PC floppy controller
cards have not had single density FM type compatiblity for about 15 years.
1050s with US Doubler or Happy modifications can use double density MFM type
recording; AtariUtil by Charles Marslett or AtariDsk by HiasSoft is able to
access these on the PC 5.25.

Other options include the SIO2PC/APE cable and software, simple transfer
over modems or null modem transfer with R-Verter. A Happy 1050 can also
read/write 5.25 180K PC floppies.

The 1050 enhanced Dos 2.5 density is a variation of MFM. Has anyone been
able to program the PC floppy controller to read 128 byte sector, 26 sector
track MFM disks?

This sounds about right - RAMdisks are always 256 byte sectors. And I
think SDX defaults to reserving the XE banks for apps that require them,
unless you explicity tell SDX to use all available banks for the RD.

Mind you, my 256k 800xl is still boxed from my last move; it should be up
and running in another few weeks, so take this with a grain of salt.

UPDATES SINCE PREVIOUS POSTING
2002.03.15: update Marek Mikolajewski SIO2IDE info
2002.03.02: removed TWAUG
2002.02.16: removed Atari Phoenix Project
2002.02.02: added Twilight World, Montezuma's Revenge, Cosmic Tunnels
to Video-61
2002.02.02: updated Satantronic product list
2002.01.26: added Compyshop to ABBUC product list

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
```

them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

2071. FA: Original children's educational software for Atari

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-06 10:38:54 UTC
From: tunamike@atomictuna.com
Message-ID: <923500c8.0204060238.45d8f01f@posting.google.com>
Source record: 30242

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2015202519

This is a lot of five educational titles for the Atari 400, Atari 800, and related computer systems.

Snooper Troops

Spinnaker Software. Case #1: The Granite Point Ghost, by Tom Snyder. Someone is haunting the old Cable Mansion. It's up to you to find out who. But don't get caught! Ages 10-Adult. Box, manual, floppy disk.

Adventure Creator

Spinnaker Software. Make mazes, monsters and more as you design incredible adventures that will challenge your friends -- and you! Ages 8-Adult. Box, cartridge.

Matchmaker Dictionary

American Educational Computer, Inc. Matchmaker Dictionary works on the principle of matching words and their definitions or descriptions, up to four lines long. It is excellent for lessions and games in any subject area which builds upon identification, description and definition: Language Arts, Social Studies, Math, Science and others. Box, manual, floppy disk.

Matchmaker Phrasebook

American Educational Computer, Inc. As the name implies, Matchmaker Phrasebook works on the principle of matching phrases of up to twenty letters. Its is excellent for lessions and games in areas such as: Bilingual Studies, Language Arts, Social Studies and others. Box, manual, floppy disk.

Story Machine

Spinnaker Software. With Story Machine you'll have fun writing your own stories and seeing them come to life. Ages 8-Adult. Box, manual, cartridge

2072. Dreamcast Atari 800 Emulator

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-06 12:10:29 UTC
From: Aaron Wheeler <holmesatari@hotmail.com>
Message-ID: <qyBr8.2123$Og6.206492@news02.tsnz.net>
Source record: 30243

I just tried out the Atari 800 Emulator 0.5 for the Dreamcast, and what can I say??? It's great. Full sound support now, works with no slow downs and worked on every game I tried on it.

Rally Speedway is now gonna be overused again, now that I can play it on the big screen tv without having to drag my 130XE setup into the lounge! ;-)

If you have a dreamcast, and a cd writer, I highly recomend it. Go to here http://www.boob.co.uk/emulators/other.html#Atari800 for the emu.

Obviously a few things need doing in this emu, like the menu's need to be made more DC orientated. etc. But the fact it didnt struggle at all with 4000 ATR images in one directory and 2000 atari executables in another, is excellent!!

I dont have a DC keyboard yet, but think I'm gonna get one now... :-)

Aaron

PS - No I havent 'sold out' with the Dreamcast. :-) I prefer to look at it, as another converted console for the Atari-cause! ;-)

2073. Re: ANNOUNCING ARCHER MACLEANS WORLD KARATE CHAMPIONSHIP NOW ON

> sometimes i just plug the cart in, and let it play the music, and watch all of the different world wide scenarios in demo, its awesome. <

Ditto, Lance. Surely one of the very best game demos ever done for the 8-bit. The graphics may not be quite as clean as Karateka (sp?), but the music and the background scenes set it apart. I wonder what it would look/sound like today on the X-box or PS2...
Larry

2074. Re: Atari800 gameson 5 1/2

>Has anyone been able to program the PC floppy controller to read 128 byte
sector, 26 sector track MFM disks?<

Yes, although I have not tried it in the past 5 years or so (several PC's ago).
The controller and DOS interrupts had no trouble with 128 byte MFM sectors.
IIRC, someone provided a link to a listing and explanation of the various types
of PC floppy controllers that would/would not do FM as well as MFM (?)
Larry

2075. Re: Newell 256K and SpartaDOS question

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-06 14:28:50 UTC
From: Bob Ryan <ryanr@one.net>
Message-ID: <3CAF0622.121CAF7F@one.net>
Source record: 30246

When I first go into the FORMAT menu (before I select a drive),
SpartaDOS reports 184320 bytes with 720 sectors and a 40 track/SS drive.

When I select 9 as the drive number, this changes to 114432 bytes with
447 sectors and double density.

I cannot change anything on the menu other than the drive number and
volume name.

In the documentation for the "130XE compatible" mod, it states "switch
to "newell" mode" to see 192k. My concern is that I' only seeing 112k.

I'm wondering if I have some bad RAM chips?

-Bob

No. SDX was designed with Basic XE in mind so it always reserves the XE
banks for use with OSS super carts.

You can over ride the default configuration by having a boot floppy with a
config.sys file.

Message-ID: <3caf3a36_1@mk-nntp-1.news.uk.worldonline.com>
Source record: 30099

Yeah the split works. If I connect the 400 by itself I get a good picture.
If I connect the ariel by itself I don't get a picture on that channel but
there is somekind of weak signal there. If I connect the 65xe on the
splitter it seems to work fine, i see all channels and the 65xe picture !

2079. Any problems running Stargate on 130XE w/ ape?

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-06 20:58:41 UTC
From: SoftNGui <softngui@earthlink.net>
Message-ID: <5kJr8.21217$nt1.1730409@newsread2.prod.itd.earthlink.net>
Source record: 30100

Hi

I just got an sio2pc cable and downloaded the ape software to try it. I have no problems getting most stuff working correctly...altho when I tried Stargate on it, the 130XE just displays garbage on the screen. Any known compatibility problems with this? I know its an unfinished game, but was curious if it should be running on 130xe's or not. TIA.

2080. Re: Question on Atari 8-bit games with sound problems on emulators

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-06 23:37:26 UTC
From: Sheddy <cghutt@hotmail.com>
Message-ID: <a8o0rm$5mc$1@paris.btinternet.com>
Source record: 30101

Hi Mike,
good to hear you're still working on the emulator. Hope you can keep the
speed up (new atari800win3.0 too slow on my 700Mhz celeron).

I think "Mirax Force" is a game that was having problems on emulators
because of how it used STIMER - there is some speech at the beginning. Sorry
don't know the technical reason why, but the pokey timers were always
buggers to use on a real atari too!

"Whomper Stomper" had speech, but I think this works ok on most of the
atari800win emulators. But maybe still worth checking it's ok with Pokey.

I'm sure you already thought of it, but.
A real good test might be to throw some recent demos at it and see(hear!)
what happens. Some of those guys get some real good results in unusual ways.

Hope this helps. Good luck.

2081. Different text sizes

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-07 09:33:56 UTC
From: Don Holmberg <donholmberg@shaw.ca>
Message-ID: <3CB012E0.2D64BC9C@shaw.ca>
Source record: 30102

Okay...before you start shaking your head, I'm a "newbie". Yup.

Programmed on the 8bits as a kid, but damned if I can remember
everything now.

I'm interested in getting different sized text on the screen at the same
time, yunno, like the text from gr.0, gr.1, and gr.2 on the page
simultaneously. Like on Miner 2049'er.

I'm using Atari BASIC right now, because I have a few books. I'm also
starting to fiddle with Assembler, but I don't have a good environment
for that now (speaking of which, does anyone know where I can get good
programming tools in .ATR format?)

Thanks in advance,
-Don

To do what you want, and lots of other fancy stuff besides, you can create your own display list. With this much-used (and fairly simple) method, you could theoretically have every video mode on the same screen. Mapping the Atari has some good info on display lists. It's now available online but I can't remember which site has it.

I think I have the MAC/65 assembler on ATR format. Or XFD ... whichever, I use it on an emulator.

I was given (yes, you read that correctly) a Black Box recently. However, it seems to be faulty in that nothing happens when I press the left button. The board also has the Floppy Board fitted to it.

I have a feeling that one of the unit's previous owners messed around with it for some reason. Are there any BB owners here who can give me a list of the ICs that should be on the board?

The guy who gave it to me apparently paid the previous owner (Max Gerum from the now apparently defunct Tyne & Wear Atari User Group) around 300GBP for the unit, tried it once, couldn't get it to work, and put it away.

David

ok, I give up - has anyone else managed to burn this to cdrom ?

The closest I have got to getting it working is by using 'Self Boot
Buddy 2', but all I get is the atari screen with a a message saying
'sorry this program needs a real atari/OS' and I can't select any
files under disk management.

this is the directory structure I created -

root -
IP.BIN (used makeip.exe to create this)
ATARI800.BIN (renamed from ATARI800.scrambled)
ATARIXL.ROM
ATARIOSB.ROM
ATARIBAS.ROM
5200.ROM

root\disks
MULE.ATR

any ideas??? I'm stuck...

CLASSIC GAMING EXPO 2002 SHOW DATES ANNOUNCED;
MULTIPLE ANNIVERSARY EVENTS PLANNED

VALLEY STREAM, NY (March 17, 2002) -- The organizers of Classic Gaming Expo have announced the dates of the 2002 show to take place at Jackie Gaughan's Plaza Hotel. On Saturday, August 10, and Sunday, August 11, the computer and gaming industry's most innovative pioneers will gather in Las Vegas to attend Classic Gaming Expo 2002. Dubbed CGE2K2, the fifth annual event will celebrate multiple historical anniversaries and is inspired by a strong, continued commitment to classic game updates and re-releases by the industry's major publishers.

Heading up this years celebration are several historical video game anniversaries, most notably of which is the thirty year anniversary of the founding of Atari. Officially formed in 1972, Atari has become a name synonymous with videogames and is still in existence today under the guidance of parent company, Infogrames. In addition to the formation of Atari, 2002 also marks twenty-five years since the release of their Atari 2600 game system, one of the best-selling consoles of all time.

Other milestones being celebrated at this years expo include the twenty-year anniversaries of the release of both, the Coleco and the Vectrex game systems. These systems, released in 1982, helped to revolutionize the video game industry. "It's amazing to think that all of these important historical events have anniversaries in 2002," said Sean Kelly, co-promoter of Classic Gaming Expo. "In addition, there are several smaller events to commemorate including our fifth year of organizing CGE."

Other items of interest at this years show include an updated museum exhibit, numerous additions to the guest speaker list, and the release of several new games for various classic systems. The Classic Gaming Expo museum encompasses hundreds of items including many one-of-a-kind prototypes. The museum contains the largest public display of classic game hardware, software,

and memorabilia in the world. "What makes the Classic Gaming Expo Museum so special is the fact that it's comprised of items belonging to dozens of individuals," states co-promoter John Hardie. "This is not just a single person's collection but rather a grouping of items on loan from enthusiasts as well as many of our distinguished guests."

Aside from the numerous keynote speeches by various industry legends throughout the show, CGE 2002 will play host to a large number of classic videogame vendors and exhibitors. While many of them will be selling mint-condition hardware and software from the days of old, others will be presenting new products for sale for systems such as the Vectrex, Colecovison, Atari 2600, 5200, Lynx, and Jaguar as well as many of the modern-day consoles.

Other show highlights include various classic console game stations, tournaments, raffles, door prizes, and an incredible number of classic coin-operated videogames, all set on free play for the attendees.

"We're thankful for the on-going support and interest shown by the videogame industry," notes co-promoter Joe Santulli. "We feel it's vital that the history be preserved for generations to come."

Now in its fifth year, Classic Gaming Expo remains the industry's only annual event that is dedicated to celebrating and preserving the history of electronic entertainment; bringing together industry pioneers, gaming enthusiasts, and the media for the ultimate experience in learning, game-playing and networking. Classic Gaming Expo is a production of CGE Services, Corp.

2092. 8-Bit printer options

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-07 21:29:25 UTC
From: Greg Reimer <ggreimer@mb.sympatico.ca>
Message-ID: <3CB0BA35.6F8AE442@mb.sympatico.ca>
Source record: 30113

Are there any newer printers available to work on our atari 8-bits?
I've been using an Olympia "electronic compact" dot matrix (since the
beginning of time) using a Axiom interface. It's always worked fine but
I'm tired of using fan fold paper. I greatly desire to put a single
page of any color into the printer and use my Letter Wizard, Print shop,
etc , without the hassle of feeding the fanfold through the system.
Are there options? My 800 and xe computers sit faithfully with their
1050 and indus drives, I'm using them for playing games with my boys but
when it comes to a printing job or utility I head for this thing I'm
using now just because of the ease.
Is there any hope? Please let me know.

Greg

I have found that sometimes the Black Box acts wonky if the power supply
is loose, and if the Floppy Board isn't making good contact with the BB
motherboard. The first thing I would try it to separate the Floppyboard
from the Blackbox and reseat it. I would reseat any chips which are
socketed as well. Then I would make sure the power supply is connected
snugly. If none of this works, perhaps an email to CSS is in order.

Good luck.

Willy

2096. Atari 800XL video help

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-08 05:59:15 UTC
From: brigand@chek.com
Message-ID: <b68c1995.0204072159.1b2968de@posting.google.com>
Source record: 30117

I just added an Atari 800XL to my collection of early-1980s computers. The machine seems to have a problem with video. Unlike the plain Jane 800, the 800XL has a five pin DIN port marked video as well as an RCA jack in back. I stuck an RF switchbox on the back of the TV (one known to work with an 800) and tried three different RCA cables between the switchbox and the RCA jack on the XL and all I get is a flickering grey screen (like the V-HOLD was out of whack, and the TV is B&W, which doesn't help). There was no such flicker when I had the 800 connected.

What gives? Is this machine dead? Bad video? I made sure all chips were seated securely, blew out the inside of the machine with compressed air and verified that I didn't have cracked solder joints on the underside of the board, all with no improvement.

I'd try the machine with an old dedicated color monitor, but it appears that the DIN to RCA video, audio (like a Y-cable) is damaged. The RCA plugs have separated from the wire and I can see a main wire going to the prong, a bare wire that doesn't quite touch the crimped part of the plug, and a sheared off black wire, which should go where?

Any help is appreciated. Thanks. This machine was quite a find for me, since I only knew one kid with an Atari when I was growing up, and I'd love to make this thing work.

2097. FA: Atari programming manuals

Newsgroup: comp.sys.atari.8bit

Source record: 30118

Lot of four Atari BASIC programming guides and manuals:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2015682197

Atari BASIC: A Self-Teaching Guide:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1528892749

This last book was listed in the regular books section, where it was promptly buried. There are only three days left, so I'm sure it'll go at a low price.

Two more lots of programming manuals to follow, one with program listings (mostly games) and another with advanced sound and graphics.

Any chance you could post a directory listing of your cd, perhaps some
of my files are missing or in the wrong place.

IP.BIN isn't included in the .zip file, is it required - or is that
only for selfboot ?

Does the IK cart detect PAL/NTSC and set the interrupt
rate accordingly for the music?

Regards,
Mark

I just have the the contents of the Emulator Archive, and I also made a copy
of Atari800.bin and renamed it to 1st_read.bin, but only 'just in case', I
didnt wanna screw a cdr so it didnt hurt having it there.. It's probably
not needed.??

I also have the Atari bios Roms in the root of the cdrom as yourself have.
I got the file names for these from the .cfg file in the archive.

> IP.BIN isn't included in the .zip file, is it required - or is that
> only for selfboot ?

not needed for non self boot. I'll try to make a self boot soon.

Have you read all the guides on www.dcemulation.com - thats the only info I
used to get it working. Also I generated a diskjuggler image, CDROM, mode 2,
2048, in TAO mode. I couldnt get Nero image to work, just kept rebooting the
DC.

2103. new version of CD audio player

Howdy folks

I just put the latest version of my CD audio player on my website at
http://www-users.rwth-aachen.de/mathy.van_nisselroy

If you could please test the 'O' command, which should now work each time as
it should with tray, caddy and slot-in CD-ROM mechanisms. If you have a CD
with or then 48 but less then 73 tracks, please test if the right track
shows up when the software is started. Please read the textfile. It
explains in more detail how to use CDAP.

Should be possible; I seem to recall an Antic article by Dave and Sandy Small talking about the same idea - using a Bit 3 80 column board (plugged into RAM slot #3 on an 800) for debugging to maintain the screen display.

Possible problems:

- driver conflicts - if the XEP80 driver uses memory locations needed by your program

- interrupt conflicts - the XEP80 is picky about its data stream, I seem to recall.

But good luck with this project!

My 800s have an integral 75 ohm RF cord out to RCA pin plug and there is a coil of some sort inside the case. The XLs have a jack on the back of the case for the cord containing the external component. It might make a difference to interferrence on the set. That 5 pin DIN monitor connection would be preferred. Pinouts are on a couple of sites.

<DELURK>

Hi All,

I bought an old 2600 today, and as I already have an american one,
is there any reason why I cannot use the US cartridges in the
European (Dutch) one ?

I know the signal is PAL vs NTSC, but apart from the obvious
difference in refresh rates (PAL=50Hz, NTSC=60Hz), is there
more to it ?

Any help you can offer is appreciated.

Kind regards,
Wef

Source record: 30134

Hello!

Does anybody have a game called "Super Heart" for Atari XL/XE? It's a game I wrote many years ago, but unfortunately I have sold all my disks and tapes with Atari. What a stupidity! Now, I can play Atari games using emulator, but I can't find MY game. My games were freeware and I got them to many people. I could find one of my games in the Internet (it is called "Logic Games"), but the game I'm the most proud of ("Super Heart") seems to be unavailable on sites I know.

Could you, please, help me in hunt for my game?

Greetings

(Off topic. But maybe someone will know.)
Can PS2 disks be copied with a PC CD burner?
Just got a RW CD and Nero and InCD software.
I see there's a video copy in Nero. Can that copy DVDs?
I doubt it, at least without a DVD reader CD.
And finally, do most PC program CDs contain copy protection
such that a burner copy won't work? Like the old A8 copy
protected disks won't work with basic DOS sector copying.

Nero will do VCD (video CD's) but they have to go through the 10 hours or so of compression from DVD before they'll work. I'm reasonably sure Nero will do modern copy-protected disks, it analizes the track layout before burning so it seems likely. I don't know about PS2 disks, but I have read about doing Sega Saturn disks, the only disadvantage is that it has to boot from a real saturn disk and then you make the disk change while it's spinning. Sounds too traumatic for me!

No, not really, and sort-of. :)

No, you can't copy PS2 discs as they are standard DVDs. You'll need a DVD burner and even then I'm pretty sure you won't be able to, I'm not sure if PS2 discs are dual-layer DVDs but if they are, then definitely no. (If all this is confusing, don't worry, just remember the "no" part.)

Nero can, I believe, burn DVDs if you have a DVD burner. You can't really copy store-bought DVDs, as most nowadays are "dual-layer" which means they have two layers of data sandwiched on top of each other, which PC DVD burners can't do. The "Video" stuff in Nero usually refers to Video CDs and Super Video CDs, which are regular CDs with MPEG files in a certain resolution run at a certain fps, which can be played in a VCD player or in many DVD players. Being limited to the storage you'll get on a CD (and limited to the required resolution), the quality is nothing like DVD - it's sort of like a VHS recorded at the lowest quality. OK, but not great.

As for protection, many newer games use a variety of protection which is not unlike the Atari 8bit protection, with forced bad areas and such. The most common now is "SafeDisc2"... but, like the old days, with the right hardware, you can still copy it - you need a burner capable of (going off the top of my head here) writing subcode info properly, as well as raw mode and several other things. The most common software used for such copying is CloneCD - www.elby.de - they have a list on their site of what burners can do what. I've got a LiteOn 24/10/40 and am very happy with it, and it can copy anything - there are only a small handful of burners that can do it all. The newest version of CloneCD includes the ability to "amplify weak sectors" which supposedly can allow burners that otherwise couldn't to successfully copy SafeDisc2-protected CDs, but you need to not be in

the US - which means that, if you are, you need to change your
regional settings (to, say, Canada.)

Thanks to both Aaron and Switchblade - I finally got it working by
using the image from dcemulation.com, the only thing that seems
different is that the working .cfg file doesn't contain cr/lf, it must
be a unix/pc thing.

Anyway, got a selfboot cdrom with all the megaimages working by using
selfboot buddy, and not only that - but the second hand games shop
near where I live is selling off second hand dreamcast keyboards (for
10 quid), so now I can select games on the multiboot menu :-))

The emulation does seem pretty good, but you are right - Mule does
seem to be suffering a bit.

hope it's fixed in the next version...

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have a new STe and an 8-bit XEGS both with composite out.

The XEGS has much better graphics output than does the STe. I used ultima 3 as the reference.

The XEGS is far sharper and well defined, unlike the STe which appears a bit fuzzy.

No one has been abe to help me find something that can convert the Atari ST best electronics 15.75khz VGA cable signal into a 31.5khz signal for use on 640x480 compatible VGA monitors. I want the ST ultima on my 36" VGA TV looking as sharp as possible!!!!!!!!!!

Thanks Ian, Mo, Daminfo.
I think I'm getting the picture. PS2 is probably a dual layer DVD,
and most movie DVDs are dual layer, PC can't do.
Many pc game CDs are copy protected, so they are iffy at best.
I don't have a DVD PC CD, just the PS2 can read DVD movies.
My wife wanted a CD burner, so she could copy a card making
PC CD, her co-worker told her she could burn a copy of hers.
Just like the old days. I'm sure there are people cracking protection
and circles to get cracked copies of stuff, only we're talking here
100s of megabytes, which I'm not going to do on a dial-up connection.

My question now is, what exactly is Aaron doing? He's running
Atari800win on his Dreamcast? Or is he burning DC games using
a PC. Atari800win is for the pc, how's that run on a DC?

You can get external scandoublers meant for the Amiga which do just that (convert 15khz up to 31Khz for use on SVGA monitors). I dont know very much about the ST's video-out It shouldnt be too hard to convert one of these for use with an ST.

Cheers,
kfb

I'm more familiar with playing PAL carts on an NTSC system,
but I think the problems you may see are just that the image
might roll (requiring a vertical hold adjustment), and the
colors will be off -- possibly showing up as black & white.

If anyone knows better about playing NTSC carts on a PAL
system, I'd love to hear details too!

My recollection is that many of the dot matrix printers (9 & 24 pin) accepted single sheets. The issue would be a printer driver for graphics, but many emulated the epson fx. You don't say if you're in the market for one, but I have at least three (maybe four or five) of them around here along with some ribbons. Price = Cost of shipping or free if picked up. Contact me if interested.

From: Steven Lashower <lashower@nospam.netcom.com>
Message-ID: <45q7bus86nbuaqnvhorvna1g9ebmsqahfb@4ax.com>
Source record: 30145

Hi All -

For those interested, I posted the source code to AMP 2.0 along with the executable and source for the unreleased "AMP Jukebox" in "alt.binaries.comp.atari8bit" There's a .ZIP containing two ATRs with Mac/65 source code, binaries, and sample songs.

I know binary groups are "iffy" at best on some newservers, so hopefully, someone will grab it and place it in a nice FTP archive. If you have trouble getting at it (or know a better place for it) please let me know.

Enjoy,
- Steve

If there's interest, I have source and executable for a assembly language Wheel of Fortune game I wrote back in 1991... Yeah, yeah...I know....but it was popular back then!!!! =)

Hello - I sent our friend Steve (APE author) some floppies, a selection of
alphaload/rob c/ian k/multiboot/warpspeed menus.

He converted them to ATR and did some jiggerypokery and reckoned that they
all worked ok when using the PC as the floppy drive and running them on a
real Atari using APE I think.

He then sent me the ATR files back which I tried on the various emulators
with no joy, so thought I'd pose the questions here.

If you want me to email you the ATR files I will do that.

Paul

I once wanted to buy a scandoubler for the ST but IIRC the guy at the
company which sold them told me that he thinks it wouldn't work with
an Atari. Therefore I didn't buy it. So if anybody who really tried
to use one could tell about his experience I would be very interested.

Because your 65XE isn't a 400 or 800 computer :-)

Clean-coded programs are no problem, but some "less-clean" coded are. Just load up an Atari 800 o.s. in your 65XE and it'll probably run. I have a diskbased one which can be downloaded from my site: http://www7.brinkster.com/atari/ataridl/dosutil.htm#top (it's the last file in the list).

You may also ask Lance Ringquist (Video61) for more info, since he just released such a translator on a cartridge...

I apologize for the length, but I just have to tell someone. :-)

A while ago I picked up a BlackBox and along with it came another box with the hard drives.

The drive box is from Xerox and about the same length and depth as the original IBM PC, but it's about half as high. The BlackBox ROM has a sticker that says "BB 1.34" on it. I don't have the FloppyBoard.

The person I bought it from hadn't used it in years and was unsure if it would work and didn't have the power supply for the BlackBox. Thanks to Nir for supplying one for me.

I couldn't get the setup to work. I put it on the shelf for when I had more time to experiment with it.

Tonight I had the time. I opened the Xerox case and found two Seagate ST501 drives and a Konan controller card, plus the power supply. I noticed one drive would spin up, but the other wouldn't. Further investigation revealed that there was only one drive with power connected. The card and other drive were unpowered. I connected the card and other drive.

When I booted everything, the BlackBox still wouldn't "see" the drives. I unplugged the drive cable from the BlackBox and turned it around. When I powered everything back up, it worked! It booted off of the first hard disk partition so fast I couldn't believe it.

Anyway, I'm so thrilled. My wife, however, thinks I'm nuts.

There's 7 drives configured across both disks. It uses MyDOS 4.5, so I have some adjusting to do.

If I remember correctly, the person I bought it from said he used to run a BBS with it. On one of the partitions there's a subdirectory named "Board", but I haven't had a chance to investigate yet.

It is getting harder to find printers that work with plain old epson codes.
My Canon 4100 bubble jet does, so I use it, still playing with graphics.

I also have a HP Deskjet 500 with Epson cart I use for commercial
software(PrintShop) with legal paper, and with Paperclip in native mode.

I can also use the HP Laser printer, for fast printing of text documents.

Each has their place.

All need an 8 bit interface.

Hmmmm. 256K less 64K main, less 64K BXE is 128K or 1024 single dens
sectors. Not less overhead.

Most ramisks are single density, but if yours is double thats still 512.
Should have 499 or so free. But I don't know how SDX handles it.

I'd recheck the wiring.

You can change the channel the 400 works on, or you can open up the 400 and use plastic tools to adjust the rf modulator. I'd paint marks on the little coils and the metal case so I know where I started.

One hole should be picture, one audio.

Programs with Trace probably map to the standard screen handler. Changing this is probably hard.

Easier to send your programs output to the second screen, use the main for debug. But, it would probably have to be plain text.

I just end up adding my own print statements, on screen or send them to the printer.

Hello!

Please could somebody help me?! :-)

I am trying to set up an 800XL emulator to play all my favourite games
from my youth!

Yesterday I downloaded the XFormer2000 emulator and a number or .atr
game files. I can get DOS to boot, but I have no idea how to get the
games to run!

If anyone can help I would be very happy - I can go home and play all
the games I used to!

Many thanks!

Katharine.

yes this one is really great. And it's much more complete than the ik+
project, which maybe will never get finished..

Do you have some news to the vector project (doom clone on 8-bit
atari) project? The site got no updates for month :-(... on the
pictures it's looking nearly playble, but never got a real working
pre-alpha version!

But anyway. Space Harrier is exciting. I never have seen so fast 3d
like graphics on atari in that speed!

Source record: 30073

It's a phenomenon that hits most relatively quiet groups from time to time.

Some guy has a LONG file that he has to break up into many pieces and send to a friend. He figures, hey, this group isn't doing anything. Let me send it to my friend via this unmoderated group. Nobody will mind.

The multi-part message in this case is apparently Divx files that he or someone else has ripped from some DVD or other. Somebody who wants to make use of all of those parts has to download all of them. The history of binary groups is that some servers lose messages, so the scheme doesn't even work all the time.

But those files are clearly off-topic. If anyone cared, they could report the poster to the abuse address listed in his headers. However, I've seen some cases where there's a statement in the header that the abuse address will not work unless ALL of the poster's headers are sent to them. Somebody would have to be pretty dedicated to preserving the integrety of an unmoderated, binary group to go to that kind of trouble.

> Atari800win on his Dreamcast? Or is he burning DC games using
> a PC. Atari800win is for the pc, how's that run on a DC?
>
> Russg

People have been porting some PC programs (usually emulators) to the Dreamcast for a while now, so someone takes the code for the PC version of, say, Atari800Win, and modifies it to run on the Dreamcast (which is supposedly very easy to code for - I seem to recall that it actually uses a modified version of Windows CE for an OS...) The DC owner then burns a CD containing the DC version of Atari800Win along with a bunch of disk images, and loads that, and there you go. Interesting but the DC doesn't have the computing power to run some of the more modern emulators at full speed (or apparently even some of the Atari games like MULE.) I believe that a few emulators have been ported to the X-Box already, and the PS2 is getting a Linux development kit which should (I would guess) allow easy porting of emulators to it.

If you really want to play a lot of emulators on the TV, though, I think the best is to get a Shuttle SV24 (www.spacewalker.com) and build that up - it's a very small aluminum PC case with everything you need to build a cheap PC except for CPU, memory, and hard drive, including video-out so you can hook it directly into your TV. $250, add in the hardware you need and you're spending well under $500, and have a nice small box that you can use to play most any emulator there is on your big screen. I haven't done this yet but it is on my list of things to do. :)

IMHO: If you really feel up to it install a dual OS chip in your XE. They provide great compatibility and usually some extra perks.

Dripping with irony.
"What do you need so many fishing poles for?"
ANS "Well, one is for deep sea fishing, one is a fly rod, one is a
backpacking rod, one is an ultra light, ..."
"Why do you need so many guns?"
ANS "Well one is shotgun for wing shooting, one is a deer rifle, one is a
varmint gunhis one is just for plinking, ..."
"Why do you have so many computers?"
ANS "Why do you have so many pairs of shoes?"
"You heartless bastard! How could you even think of asking such a question?"

It would be funny if it wasn't true.

Is there *any* difference between the cartridges (or even systems) that were released for Atari 400/800 for the US market, versus those that were released in "PAL" countries? Or are the games identical, working equally well on either a US Atari 800 system and "PAL-countries" Atari 800 systems?

Source record: 30083

I just gotta Atari XE from a friend of mine. It was in his dump
pile on the back 130. The atari had been there for over 3 years
in rain and snow.

I got it, power supply, keyboard, joystick, light gun, and four
games (pole position, bug hunt, barnyard blaster, flight simulator2)

brought it home and plugged it in. Works great.

Where can I find disassembly of Barnyard Blaster at?

Are there any good games for this computer? I like the light
gun games...

Are any other Atari cartridges compatible with the system?

Where can I find FAQ/ specifications for this system?

I think most of the designs were lost when one of Atari's iterations
liquidated many of their assets. Old designs may still exist in the hands
of private collectors and old employees, but I'm fairly sure Atari as it
exists today holds little if any.

(Check out www.atarihistory.org for lots of Atari neat stuff)

Oh my God! I asked this question and got the cold shoulder for a week.
Glad to see that I'm not the only one.

I'm at the point now where I have to promise to get rid of something
before I can acquire anything else. The drive to Toledo for the "free"
800XLs and misc. stuff was the last concession.

The interesting thing is the wife is a financial analyst and works with
Excel all the time. One day I booted the 800XL and loaded VisiCalc. She
was floored. She had no idea that something like that existed. I just
smiled.

HI

ive just built the pc2pio interface,but doesnt seem to work,coudl someone tell me what the voltage should be on data out on the atari side ,on mine its 0.20v,which im guessing isnt correct,if it is faulty is there a way of correvting it without replacing pokey chip or atari

Thanks

Ian

Hello,

I have the ST version of Xformer and I know it works in a different way
than yours. But all these emulators that work with ATR files work in
the same way. You have load in an ATR file onto one of the virtual
disks slots. Then there should be a function to reboot the emulator
(not your computer) and the game should load.

I have such an emulator that uses ATR files for my Atari Hades060 and
it works in the same way as I described.

I heard the designs, what would be needed to manufacture the chips was left
on an old vax that was sold as salvage. Dunno how true that is, it's just
what some die hard Atari freind told me.

Funny Chuck Stiemen "Author of the Pokey Gumby" developed a Complete
Atari8bit in a PC design 10 years ago. It to had VGA graphics and simm
ram, he released info on this way back and I called him to order one.
Chuck told me he needed 15 pre-paid orders to do a production run and he
couldnt get more than 5 :(
from what he told me it had all the features as the C1 prodject. There
maybe more interest now-a-days for such a design project.

I love the idea!

Not w/o a killer application. There is no advantage to running Asteroids or
PacMan at 20 mHz.

When I first enter the format menu, SDX reports 447 sectors available
for the ramdisk.

When I exit the menu and do a dir command, it reports 440 free.

I think it's o.k.. I'll try to boot with a config file and see if I can
get the expected 192K.

Thanks,

-Bob

Hi Katharine,

If the games you are trying to load are written in basic (they have a
.bas extension) they have to be loaded with the basic cartridge
enabled (shift F10 enables and disables basic on the Xformer
emulator). To load a basic game from disc drive #1, you would type
LOAD "D:filename.bas" and press return. (filename is the name of the

game you want to load. If you were loading the game from drive #2, you would type LOAD "D2:filename.bas".

If you are loading a machine language game (they have an extension of .com,exe, or obj) you have to load them from Atari dos with the basic cartridge disabled. You would press L and then return to load the file. For instance L (return) mygame.exe return.

I hope this helps. If you need further explanation, let me know.

The SPACE (St. Paul Atari Computer Enthusiasts) BBS is now online via telnet at spacebbs.no-ip.com. The BBS is run on a REAL Atari 8-Bit Computer! Nothing fancy available yet, however there are some games and such that might be of interest. I have received several HUGE ATR's filled with all sorts of games, utilities, etc. a while back. (Over 6 MB!) Hopefully in the coming weeks I'll be able to finally make some of this stuff available. Any questions, problems or comments may be left to me via Feedback on the BBS or here. See you there!

I remember a few years back, I hooked up my HP LaserJet IIIP to my BlackBox. Obviously, It printed the text in the default mdoe for the printer and the text was pretty much aligned all the way to the top and bottom. Not too fancy, but it worked.

Just thought I'd put my 2-cents worth in :)

BlackBox, the whole computer will lock-up and you will have to restart. <

My experiecnce with 2 BB/FB's is that they are very reliable. The weakest links are 1) the ribbon cables -- especially the 50-pin scsi cable and 2) maintaining good contact going into the computer. I don't have room, but using the 800XL connector along with an MIO 130XE adapter is probably the best way to connect it. My only regret for the BB is that no memory expansion was designed in (ala MIO).

> risking to lose files when harddisks go bad sooner or later ?!?

I've resqued a partition/disk or two.....
Problem with SpartaDOS is that if you loose the directory (which is on track one in Sparta-format, meaning if something is unintensionally overwritten, the directory is one of the first things to go.) You can only hope that you will still find the bit maps. If they are gone, forget it. Repairing a MyDOS disk/partition is almost fun, repair a SpartaDOS partition is pure masochisme.

Not
> sure if this is just the way it is or dirty contacts, etc.

Power down. Take the BlackBox out of the XL/XE. Clean the contacts. White
pensil erasers work fine, but you want the plasticy, not the rubbery.

If that doesn't help and you have a FloppyBoard, see if the connections
between FB and BB are OK. I've improved mine, check out my BlackBox page at
http://www-users.rwth-aachen.de/mathy.van_nisselroy/blackbox.htm

CU Mathy van Nisselroy

PS also make sure flat/ribbon cable doesn't get moved around to much. The
copper inside will break and give all kinds of nasty side effects. Like
spontanious formatting when accessing a disk.

I was thinking more along the line of displaying the contents of variables on the XEP80's screen. Or let's say you're not sure if the IF THEN (in BASIC, in other languages there are simular conditional jumps/goto's/gosub's) is working as you had intended them to work. With the XEP80 you'ld have 24 lines of 80 characters EXTRA to put stuff on. You could display lot's of variables and lot's of line numbers on ONE screen without it messing up the output to your normal screen (the stuff the user get's to see) or your data scrolling off the screen/being written over.

I knew Jerry Ellsworth had developed the system, but I can't fathom anybody being stupid enough to steal her prototype. There's an ass born every second in this world. I hope she still drives on with the project!

Then we need to talk with her about developing the Atari version. ;)

I'd like to see a generic 65816 motherboard with "personality slots". An
Atari card for this slot would have updated versions of the custom chip set,
as well as a ROM. A Commodore and Apple 2 GS version could be built as well.
The advantage here is that there is one basic computer to build and support,
but that could be compatible with as many as three.

Hello Lance,
you are completely right on this one !! I always take Karateka as a good graphics/game demo - but almost never play it, because of the bad joystick responses. Whereas W.C.K. or International Karate (under this name the europeans remember that game) has both great graphics and gameplay.

By the way: Does the cart version include all 6 gr. screens ?!? Well, I am asking because I have seen a lot of pirate versions (file-versions) which had only 4 or even less screens... (and yes, I also have the original disk!) -Andreas.

Source record: 29978

Well,
the AMP jukebox was released in STart magazine around 1990 or 1991 - I have it on every of my 16 AMP demo disks. You can also find the AMP jukebox on the Pooldisk Too - just take a look into the subdir Antic (think STart was the follow-up magazine of antic, that did not last long)...

Hmm, wheel of fortune ?!? Think there was a release of that game in Antic or Analog with built-in editor to create your own levels (words)... but hey, I am always interested in new/unknown software, just get me a copy... Since I am not a programmer (not at all!) I merely need the executables, not the sources. -Andreas.

P.S.: AMS and AMP are both cool sound processors. Not up to date, but they contain all those great sounds/songs of the 20th century (especially of the 70s and 80s). Man, I wish the polish programmers would use these sounds in their sound processors like MPT, CMC and such instead of that boring techno/rave/house/acid stuff ...

Well,
it will help !! Because you have to unplug the translator cart. then press start+Option together and a one-color screen appears. now insert your 800 only cart. Of course the ultra-translator is also avaiable as a file...

the best thing is to make a copy of an atari 800 os and insert it (piggy-back or whatever it is called - on top of the original OS) into your computer with a switch. Then you can just switch to the old OS when needed... -andreas.

P.S.: When I used the translator with MM I could see the title screen, but as soon as I started to type in level number and difficulty (on the keyboard) it hang up. when I used the old OS (with the switch) the game ran fine...

You never know. Maybe a young woman stole it, too. <g>

I've been thinking about this thread since it started. I've concluded
that it might be more prudent to implement something based off the
Motorola 68x00 series of processors in a generic fashion that utilized
a ps/2 keyboard & mouse, a VGA card, IDE drives, etc., and have a
plug-in "personality module" containing the necessary ROM and
connectors to emulate an Apple, VIC, C64, Atari, etc., and utilize
their various unique peripherals and cartridges.

The new processors have so much muscle that it's easier to emulate an
entire 8-bit 6502 computer in software than to replicate the unique
silicon or deplete the diminishing stock of spare parts. Besides, it
would also leverage a considerable body of knowledge regarding
emulation of these machines.

Another benefit would be that the fundamental development costs could
be distributed across potential customers who were enthusiasts of all
the fine old 6502 machines, not just the Atari, Commodore, or Apple
alone.

Just thinking out loud...

Regards,
Brett C. Cammack

Great minds think alike. <g> I guess I should've read all the new
messages on this thread before posting my previous message.

I selected the 680x0 CPU simply because it's easier to design into a
16/32-bit hardware model and utilize contemporary subassemblies to
expedite implementation and reduce costs.

there is a difference, the pal carts will work in NTSC machines but the scan rate is different. If you are hooking it up to a tv with vertical hold control, you can probably use the PAL cart in an NTSC machine. Without adjusting the vertical hold, the screen will roll, also the colors may be off.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Actually I was being a bit naughty, the carts do work in either
machine with the rare exception of as you say a timing issue of which
I really can't remember a single cart but there may have been one or
two somewhere out there that used the freq for its update.

It would be a small amount at worst.

I think Silica Shop in the UK would have gone out of business if the
US carts had not worked in the UK machines :-)

So I'd imagine the PAL's would be fine on US (I can't verify
personally too many but I know the ones I had did)

I imagine the best stuff for that is a PCB cleaning block (like an eraser
but more coarse). Think I have a still lump of it in my toolbox.

It may well be that the menu button is faulty. One way of testing the BB might be to use the software loader linked to on your site. If I use that and can access the BB's menu then I know the unit itself works, thereby suggesting a fault with the button or an IC that triggers a read from the ROM when this button is pressed.

At the moment, whichever machine the BB is connected to works correctly (doesn't crash) - it's just that the BB doesn't.

Ron,
You are a diehard! The 825 is actually a Centronics 737. I don't know
if the ribbons are still available for that beast. Radio Shack used
this same mechanism for TRS80 printers, so that might be source.

2231. Flip & Flop??

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-13 18:21:43 UTC
From: I-Hate-Spam <I-Hate-Spam@att.net>
Message-ID: <XG_t8.21786$Rw2.1749878@bgtnsc05-news.ops.worldnet.att.net>
Source record: 30002

Hey All...

There is 1 game for my Atari 800 that to this day, I haven't been able to find on any other system (i.e. dreamcast, n64, nintendo, pc, etc). The game is: FLIP & FLOP.

If anybody knows if I can somehow play this game on my Sega Dreamcast (or any other system other than my atari 800), PLEASE let me know.

I recently noticed messages about an atari emulator for the Dreamcast. I unfortunately have been unable to figure out how to burn it, etc... However, if somebody could provide me with a way to play my old all-time favorite Atari game "FLIP & FLOP" I would be GRATEFUL!!!!

ANY help/info would be enormously appreciated.

Basically it's just another emulator, right? How would this be better than
the current emulators running on X86 systems? Are the 680x0 processors still
being manufactured?

hi neil,
you do not lose the data because once you power up your xe with the
translator cartridge installed, all data from the cartridge is
immediately transferred into ram.
then the cart port is turned off via commands in the cart code, so all
you have to do is pull the translator cartridge from your machine, then
follow the instructions for booting a cartridge.
the cartridge is $19.95 u.s.a. funds plus shipping.
you can find the cartridge listed on our web site at,
www.atarisales.com
thanks,
lance

Do you mean like make a happy backup of a disk in another drive that's not a happy. I think not, there is a happy dual drive utility that allows backup from one happy to another on the SIO chain. Maybe I misunderstood your question.

Hello Bob,

My wife is a CPA and also works with Excel on her PC. She too is not very aware how good the Atari 8-bits were and thinks they are toys. She does not know everything about computers as she thinks she does as she just asked me yesterday how many k are in 1.55meg.

I am at the point where if I see some Atari item I want, I just buy it. She does the same with clothes. (g)

Knew it was too good to be true! I have no great experience of autoboot and disk routines without the OS(although it should be simple). Now my 800xl is fixed, I'll have to try some things on that.
Other people have not had trouble with APE, and I haven't got it. Does it happen everytime? (Could be a corrupt image?) Is that sector 55 or the 55th sector read?

Thanks
Chris

I'm not sure I follow.
Someone wants to replace their original 'Jumpman' (John Perez).
You can find a .PRO image at ftp.spudster.org.
That will allow running from APE. I don't think you can make
a disk out of a .PRO image. There's also a .XFD at spudster.
That one is probably cracked and you can make a disk out
of an .XFD image.
A bit confused at the moment.

If you have a pretty fast PC, you can run Atari800winplus or something
like that. It would run the image, available at ftp.spudster.org.
Aaron Wheeler would have to explain how to burn the Atari emulator
on a DC. Then you could also burn flip&flop on the CD and play
it on the DC. As I don't really understand it, but it seems that
Aaron modified the PC code for Atari800win to run on a DC.

I'm afraid I don't know about the UK.
BG Micro, in Texas has them (4164 chips), either 100 or 120 ns,
for .75 and 1.00 (US). The problem is I guess a minimum order, and
the overseas shipping. I'd be pretty sure Best also has them, but you'd
have to buy their $12 catalog, which I hear is very much worth
the $12, and their prices tend to be high.
I recently went searching for some Indus drive chips and got them
for higher prices from other places than BG has them.
Well, I hope somebody in UK can point you right, or just buy another
800xl, probably cheaper than getting the chips from the US and then
you'd have the old one for parts.
Regards,
Russg

Because it would be a dedicated emulator and not encumbered with all
of the baggage of a "WinTel" PC. It would also enable use of all the
hardware one might aquire, even the actual cartridges. The 6502 is
too constrained to make a reasonable attempt to implement a box that
could morph it's personality across the entire line of 6502 machines
that came out in the late 70s and 80s. Additionally, it's
cost-prohibitive to replicate that custom silicon they contained
unless you emulate it, and there's already plenty of prior art in the
emulation of those chips to reimplement it on a 680x0 platform.

I do believe that the series is still produced by Motorola. Part of
their "Digital DNA" series.

Yep - I just can't get myself to buy a game twice because the copy protection scheme has caused the disk to fail. I would just be pleased to be able to play the games that I own.

I wish there was a way to store all of my 8-bit software on a non-volatile medium, without connecting it to a PC with APE, etc...

Hmmm... Anyone ever tried attaching a magneto-optical drive to a CSS Black Box?

Anyone ever tried attaching a magneto-optical drive to a CSS Black Box?

The main reason that I have always wanted to get a Black Box, is that I want to get as much of my 8-bit software that still functions onto a more reliable storage medium. Unfortunately, given recent experiences, even a hard disk wouldn't leave me feeling very secure. I am curious as to whether anyone has tried a SCSI Magneto-optical drive.

Any Black Box users (or sellers) feel free to contact me. I'll need some advice.

Aloha!

Source record: 30033

Shawn,
you have a standard 130xe? no 3rd party memory mods, like your 800xl?
I'm not checking (yet) for memory mods - some work, but if they change the way the 130xe normally accesses the memory banks, then it will crash at some point. I checked out sector 55, and it would be the very last sector it loads before trying to run the first screen.
If it's not that, then I'm stumped :-(Some other guy at www.Atariage.com message boards said he tried it and it worked fine with his NTSC and APE (don't know what version it was though)
You could try making a new disk image in case something corrupted somewhere along the line.

Thanks
Chris

Slight misunderstanding which you partky answered, re: SIO chain.

Can a Happy drive create a file you could transmit, with info needed for a
2nd Happy to generate a working protected image?

It was the sequel in a cart containing 12 to 15 levels; the original JumpMan
disk version had 30 levels - all different from the cart.

There is a JumpMan Lives PC version out on the net with all 45 screens; not
exactly the original, but still very playable.

I use HP LaserJet 4Ps on my Ataris. They are one of the last front panel selectable cheap printers - from which you can select your default fonts, etc. The newer laser printers can only set fonts and operating modes thru the interface, not impossible, but not as easy as selecting on the panel. This does allow you to print just about any point size of the internal fonts in the printer on your Atari.
Either way, you really have to do a little work to get properly formatted output from a word processor. I have managed to use the proportional font setting with AtariWriter and printer driver creation utilities to get good results.

Source record: 30039

Happy software used PDB (pre-defined-backup) files that contained
copy-protection info for popular titles of the time. From what I've learned,
some of these were the only way to backup certain titles, and then only the
happy drive could use the backup disk. Electronic Arts was one of the
companies which this system was required to make backups. In my
documentation (or lack of) there's no explanaition on what the PDB consists
of or how to create them. They also promise to release more disks of PDB's
at a later date, but they never did as far as I can tell. The Happy software
disks has them on both sides.
As far as I can tell, there's no disk-to-file utility that I'm aware of. If
someone knew of any for the Happy drive, that would be pretty impressive.
I'd sure like to know what's in those PDB files, if you have an ATR of the
Happy software, then you have them just poke around the disk.

2269. Turboflex for 8bit.

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-15 04:08:49 UTC
From: Atari-Chart <SPAMMENOTatari-chart@shaw.ca>
Message-ID: <nalkbuouec9heums5d0jpjqi5m0g3jb09l@4ax.com>
Source record: 30040

As I'm sure some of you are aware, Jeff Minter, the author of the game "Turboflex" (as well as several other Atari 8bit, ST, and Jaguar, and non-Atari platform titles) is looking for copies of his old games to put up on his website.

Here's a quote:

"I'm looking for a few bits and pieces to put up on the History section of the new website - I intend to have a page for each game, detailing how and when it was designed, and presenting examples of the various incarnations of the game on various systems over the years. Ideally I would like to present emulator images as well on these pages, so that people who are really that interested in the games' history can download and play the originals.

I have many of my games in emulator file format (that's Super Deflex on the Spectrum above), but by no means all of them. In particular I'm looking for the following titles: Deflex on the ZX81, and Turboflex on the Atari 8-bit. If anyone out there knows where I can get them, het me know, would you? It'd be a great help... 'course, they may just be lost by now. But the Net's a big place and I can't have looked everywhere yet :-]."

Check out his web site at:

"http://www.enormouscamel.freeserve.co.uk/"

Help him out if you can, and check out what he's been up to lately. New games for Pocket PC platform, playable on Win PCs via emulation.

I have a basic game called "Turboflex" by Jeff Minter. Is that the one?
It's a Duth licensed version, so the copyright says "Llamasoft/
Aackosoft"...

I'll try to translate the opening screen back into English...

Howdy Chris

I hardly ever play games, but Space Harrier is great. I'm still puzzled why my thumb isn't sore. (Top score, 1561680. That was after I killed the dragon. Which only happened once. It's hard to get points when your shooting the dragon, but after it's killed, the score goes up very fast.)

I've run it on a european 65XE, with an UltraSpeedPlus OS (version 1.5 IIRC), upgraded to 128kB. I loaded the game (after using DISKFORM by Ken Siders) from the 5.25" mech. that is connected to my FloppyBoard. (it load's pretty fast that way).

BTW to the left and right of the blackboarder, I see color. On the left it lookes like the normal background, on the right it's garbage I guess. Doesn't bother me. I really like your game.

Message-ID: <a9eh1l$s52$1@nets3.rz.RWTH-Aachen.DE>
Source record: 29898

Howdy folks

The following as a quote from a message Lee sent me:

There is an area of 20k between dos.sys and dup.sys that is used as a
'resident driver's buffer'. This is the area where eight hard drives are
supposed to be set up with all their percom blocks, sector skews, etc. But
with the Black Box, there is nothing there, just empty space. Its never used
for modern systems at all, and I wonder if it EVER was used in any system at
all. I wouldn't know how to hook up a hard drive directly to an 8bit such
that it would be detected by these hard drive routines and I wonder about
reclaiming this area sometimes. Have you ever seen any documentation on
hooking up hard drives without the BB, MIO, Supra or other device first,
other than Wooley's IDE? How about floppies other than SIO units like the
810, 1050, rana, etc., and/or BB floppy board? If those days never really
existed for the 8bit, then reserving 20k between DOS and DUP seems rather
stupid doesn't it? I'm not burning up to change this, yet I must ask the
question, why do it?

End of quote

I will forward all comment to Lee.

2280. Fred Saberhagen's Berserker Works Vintage Software

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-15 18:19:21 UTC
From: uniace3@aol.com
Message-ID: <22a85251.0204151019.7236fd7d@posting.google.com>
Source record: 29901

I am trying very hard to find some very rare out-of-print software. I am looking for two computer games, "The Berserker Raids," and "Wings Out of Shadow." The games were made and sold between 1982 and 1989, by Berserker Works Ltd. They were designed for home computers popular at the time, i.e. Apple II series 48k, Macintosh 512k, Commodore 64, Atari 400/800, IBM-PC, IBM-PC jr.

Berserker Works Ltd was an effort of Fred and Joan Saberhagen, and the two games I am looking for were based on Fred's "Berserker" science fiction stories. I am in contact with Fred and Joan, and they don't have a movable copy of the games. I'm trying to get a hold of the software for an official Berserker fan web site I am making.

If anyone could give me ANY information on who might deal in such vintage computer games, or even where I might look to try to find someone, that would be great. Any leads would be much appreciated.

PLEASE EMAIL ME AT THIS ADDRESS (minus the NOSPAM part):
jfinleyNOSPAM@ucla.edu
I probably won't see anything sent to my aol address.

Thank you very much,

Jason Finley

Hi Mathy,
glad you like the game demo, yes the dragon is awkward. But I'm amazed (and pleased) it works with your nicely upgraded system.
You must have real big borders on your TV/monitor, able to see the whole Atari widescreen! The expanded missiles are supposed to hide nearly the whole widescreen background colour and clipping garbage.

Chris

New processors have muscle, this is true, but you can plop the
VHDL code of the 6502 down into an FPGA on a new board
fairly easily. Check this out:

http://www.free-ip.com/6502/

Yeah, I'll give it a shot right after I disconnect. I would assume they can be backed up, the manual suggests breaking in the Happy with making backups of it's own software. Who knows....
I'll let you know what happens.

Is there any reason you *have* to play it in the DC..

You seem to be running Windows so why not use a PC emu.

I only say this as there's no simple way to create the DC image needed
as it's multiple tracks with bin files from other disks etc.

2294. Re: PC in ATARI case (=new XL computer) ??

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-16 10:46:13 UTC
From: Pockets <pockets@cix.co.uk>
Message-ID: <a9gvdlheh1@thorium.cix.co.uk>
Source record: 29915

The Idea has some merit.

However the major problem is the size of commonly available motherboards.

This would make older laptops the most likely source of bits for such a 're-casing'. But these often do not conform to standards for video/sound cards and other items.

Should i have a 'death' in my Atari family, i may investigate it as a posibility. Old 486 DX laptops with VGA and possibly sound are when found quite affordable (especialy when the batterys duff and the screen broken).

What’would be the best emulator for such an ATARI-XLPC?

```
-Xformer is fast, can access the original 1050-Floppy, but not much
compatible to an real ATARI
-A800DOS is compatible, but too old (no mouse emulation)
-A800Win PLus needs MS-Windows

To make the connections for original ATARI-Joystick should be no problem,
there are manuals anywhere in the internet, but I cannot imagin that you can
connect an ATARI-ST-Mouse and it will work.

Mirko

Definitely buggy! I don't think that these were
re-released with working images either. Still,
they weren't bad for ï¿½2.99 tapes!

> colony: put the battery into the droid - overwrites the screen, game
> hangs sooner or later

Incredibly annoying, the game concept was very good.

> universal hero: inability to enter the password.

I did patch this about 12/13 years ago. I'd put the
tape image on disk and then hex edited the thing.
IIRC, I got it so that you can type the password
but the screen didn't show this. Then you were able
to continue with the game (you've only seen a small
part so far). Anywhere I can dump the image?

> Just so i know that its screwed.

According to http://www.atari-history.com/archives/SIOspecs.pdf (page 6)
it should be 0V for logic FALSE and +4V for TRUE.

I'm not sure if this information is correct, since I would expect
+5V for TRUE, but anyway it should be significantly higher than 0.2V.

IMO the best way to check logic signals (if you don't have a 'scope
or a logic analyzer) is a simple logic tester. Many years ago I built
one myself from the schematics I got out of an electronics magazine
(it cost some 10 EUR or so). It had two LEDs (one for LOW and
one for HIGH) and also a small speaker (using different tones for
LOW and HIGH). This device helped quite a lot detecting only very
short pulses of HIGH or LOW: either by a dim, but nonetheless
activated LED, or by some very short 'clicks' in the speaker.
I even used this device for quick checks when building extensions
for the Atari plugging into the PBI and running at ~2MHz.

OTOH using a (digital) voltmeter is mostly useless because it operates
way too slow. But if you are lucky, maybe you could see changing the
voltage from lets say 0V to 0.1V whenever there's a short HIGH signal.

HTH & so long,

Hias

That is about right. .2 is reasonable for the low state. I don't recall which chip family the 800XL uses for the SIO lines, but as long as the 2 voltages are within about a diode drop of the respective supply voltages, things are reasonable. But if you're concerned about the SIO bus being blown, a functional test is necessary.

Yes- I like your idea of the speaker- though it would need an opamp or hex buffer on the front end. The line-in of an audio amp might be high enough impedance to not load the data lines too much. But an oscilloscope is really the better tool for this kind of thing. Particuarly on the Atari, the edges of the signals are complex (and slow), and a scope is helpful to see whats going on.

2300. 800XLDJ (SIO2PC software) on a TT?

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-16 15:54:11 UTC
From: rodsmith@speaker.rodsbooks.com
Message-ID: <ldhh9a.6m9.ln@speaker.rodsbooks.com>
Source record: 29921
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Hi,

I've recently gotten an SIO2PC cable (to link an 8-bit to a standard RS-232 port on a PC or the like), and it works fine with the basic DOS software on my x86 laptop; however, I'd prefer to use it with my Atari TT. There's a package called 800XLDJ (http://wwwstud.ira.uka.de/~s_tomczy/dj800.html) that's intended for this purpose, but it's written for STs, with a Falcon version also included in the archive. Unfortunately, both the ST and Falcon versions lock up my TT; they both display a menu bar and a window for selecting disks, then the system locks up (the mouse pointer freezes). The documentation's in German, and so isn't much use to me. Does anybody have any suggestions or tips? Thanks.

> more stuff in the big 1050 cases ???

Have a look at www.jumptec.com and look for "DIMM-PC" and "PC/104".
Especially the DIMM-PC is an extremely cool device IMO, but there's
one big problem (in addition to the high price): CPU-speed. The fastest
embedded PCs I know of are Pentium-class systems (running at 166MHz
or so). And most emulators I've tested so far didn't run too well on
such slow PCs.

OTOH faster processors cause other troubles - mainly heat, noise and
demand for extremely strong power supplies. So unless you want to
melt your fine Atari case within five minutes after startup (and
also fry your processor), you'd have to care about cooling.

BTW: Some 3 months ago I was thinking about building a small SIO2PC
server with a PC/104, a TFT, a notebook-harddisk, and a small
keyboard. The total costs would have been approx. 1000 EUR (~900 US$),
so I had to abandon the idea. Building it would have been cool, but it
was far too expensive - and you can get an old notebook for some few
hundred bucks and it would do exactly the same.

so long,

Hias

Actually the tester was quite sophisticated: IIRC it consisted of two
discrete comparators (built with opamps), one to check if the voltage
was in the legal LOW range, and one to check for the HIGH range.
You could even switch between CMOS and TTL thresholds.
If the voltage was within the illegal range, none of the LEDs would light.
(I don't know the thresholds exactly, but I think TTL is something
like 0V to 0.8V for LOW and 2V and 5V for HIGH - anything between
0.8V and 2V is illegal/undefined).

The output of the comparators was also used to control an oscillator.
It generated a low frequency tone for LOW, a high frequency tone
for HIGH, and silence if the voltage level was illegal.

Quite nice thingie, I have to look if I've still got it somewhere.

> But an
> oscilloscope is really the better tool for this kind of thing.

ACK. Back in the mid-80s when I started building hardware for my
Atari I always wished I could afford a scope - I was attending
school this time and had no money for such fancy stuff...

BTW: I just checked with my Horowitz/Hill, and it states that typical
output values for TTL are 0.2V and 3.4V for LOW and HIGH, respectively.

So, to come back to the original question: If DATA OUT is 0.2V (which
means LOW) _all of the time_, there's something going wrong.

so long,

Hias

I have gotten it to work on my PC.. but I am spoiled with the game systems... I can relax on my water bed & play the games on my LARGE tv... therefore, I'd love to play my old-time favorite game on my dreamcast (or any other game system for that matter -- assuming it was possible. I also have the psx)

20mhz dual channel analog scopes are becoming reasonably priced, particularly for used models- sometimes below $100 US. Which is still a good bit of money, but its better than 5-10 years ago..

Its quite interesting how oscilloscopes hold their value. At work I regularly use a 4 channel Tek that was discontinued in 1985- I estimated its current value at $8000 (probably too low since we have a set of nifty plug-in modules to go with it).

I think you're probably right. I can never remember the voltage level of the idle UART output; I <think> its supposed to be hi, then driving low for the "on" bits; analagous to the EIA voltage levels used for RS232.

I checked some datasheets too, the standard TTL hi output they mention is hi at 2.4v at 400ua, which is pretty close to marginal- and may require a pullup for interfacing to some CMOS. But regardless, the poster should be seeing at least 2 volts.

Sounds like too much hassle for so little reward.

Most people interested in the Atari have got a real one for themselves. They most likely also own a pc. Too much effort I reckon!

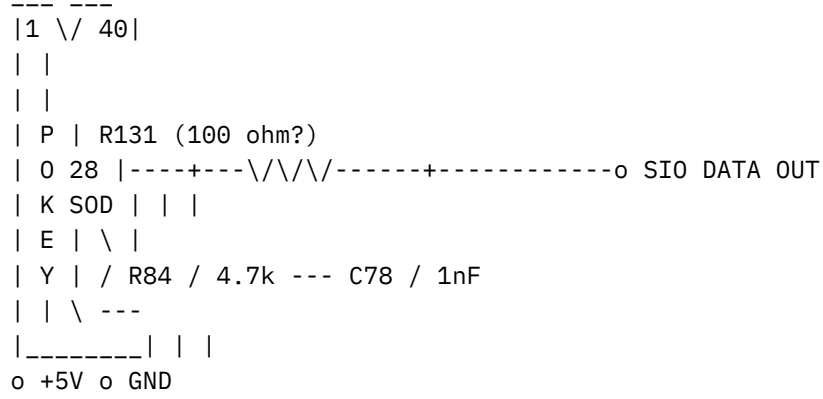
I just checked the output of my 800 XL with a digital voltmeter:
Default voltage (when SIO is inactive) is ~ 4.9V.
If there's activity on the SIO bus (measured during boot-up), the
voltage drops down to ~4.7V.

I guess it is most probable that your POKEY is broken. There's still
a very slight chance that one of the resistors or the capacitor
between POKEY and SIO connector (or maybe also a PCB trace) are
damaged.

Here's the important part of the 800 XL schematics:
(POKEY = U22 = C012294)



(I hope I got it all right, some numbers were quite hard to read)

First of all, check the voltage directly at pin 28 / SOD.

If that doesn't work, it will become a little tricky:

If you are lucky, your POKEY is mounted in a socket. Carefully bend up
pin 28 and measure the voltage of DATA OUT (on the SIO connector).
It should be ~4.8-5V (due to the pull-up resistor R84). If you don't
get 5V, check the resistors and capacitors.

Now, if you got 5V at DATA OUT, your POKEY is most certainly damaged. The SOD pin is an open collector output (therefore the need for the pull-up resistor) and normally it should by in the high-impedance state.

As a last test you could try connecting a 4.7k resistor from the bent-up pin 28 to +5V (like in the original schematics) and then check the voltage at pin 28. If it's still not ~5V your POKEY is certainly broken.

You still don't have to trash your Atari in case of a broken POKEY, try contacting ABBUC or one of the well-know dealers. There should be a good chance you can get a replacement POKEY.

so long,

Hias

Howdy Chris

> glad you like the game demo, yes the dragon is awkward. But I'm amazed
(and
> pleased) it works with your nicely upgraded system.

It works on my 128kB 65XE (which came with a 130XE motherboard less CO25953
and 2 (64x4) RAMchips)
It doesn't on my XEGS (which has been upgraded to 1MB). It stopped I guess
just when the game is supposed to start. Do you do something funny with
$D301??

I tried testing it with my 1MB 800XE, I worked, but the 800XE doesn't
function as it should. It worked when Andre Bertram checked it, then after
the mailservice had it, it started up doing stupid things. Looks like I'll
have to resolder the whole thing.... :-(

CU Mathy van Nisselroy

PS all my upgraded computers DO have separate ANTIC and CPU access, just
like a normal 130XE has. I use the same chip (CO25953).

2314. MyDOS code: now available in three textfiles

Newsgroup: comp.sys.atari.8bit

2315. Re: Turboflex for 8bit.

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-17 14:02:14 UTC
From: carmel_andrews@hotmail.com
Message-ID: <6912483e.0204170602.44fe5308@posting.google.com>
Source record: 29936

Turbo flex was originally printed in a UK magazine called page 6/or
new atari user (cant remember what issue, but i do have it somewhere)
so if they still exist, ask page 6 publisihng/les ellingham

It was basically a type in listing (by the famous 'yak' himself),
which was reminisant of the classic type in listing that decent
computer mag's had in their mag's in the early 80's (80-84), i seem to
remeber a type in listing of an atari program in C&VG and also PCW
(both uk mag's), strange because these particular mag's hardly covered
atari articles (back to the old 'anti atari' argument)

happy atari'ng

carmel

2316. FA: ATARI 2600 VCS original box and 10 Games

> >
> > I may get lots of old Notebooks for very low prices (=almost for free)
> > , the only question is how fast a PC must be to emulate an XL.

I'm not too sure, but I would estimate approx. 300MHz.

I've thought about re-using a notebook, too, but IMO it would be very
complicated:

- Actually you'd have to use a sub-notebook so that the "mainboard" will
fit into an 800XL case.
- Dis- and re-assembling a sub-notebook is not a funny thing.
- The notebook would have to support video-out (some sub-notebooks I've
seen only supported VGA-out with their port-replicator, and
composite/S-video out is even more uncommon).
- You have to build a special interface so you can use your Atari XL
keyboard with the notebook.
- And another interface for SIO (like 1050-2-PC).
- Maybe you have to modify the emulator so that it works with your
special interfaces.
- Take care that you use a robust OS and filesystem, you most certainly
would not want to trash your "virtual XL" by simply power-cycling it
10 times, for example.
- ... plus a lot more items I forgot.

> Sounds like too much hassle for so little reward.

The idea is nice, but actually I have to agree with that. A whole lot
of work, and IMHO more disadvantages than advantages compared to
using a real Atari (that you can get quite cheap).

so long,

Hias

Source record: 29941

I don't know about your data voltages.
But, you said 'bin' for the Atari. Uhm, I gotta say something.
At least it is good for parts for the next Atari you buy.
It is always good to have two, at least one working, to compare
voltages, logic probe, oscilloscope.
One thing people have said is that a 'weak' power supply can cause
problems. I mean have you checked to see that a full 5 volts is
present on (where?) near the ps connector.
Second, if you had another, swap out chips, many are socketed.
I think the Pokey has something to do with the SIO.
I used to go pin by pin and check logic probe, low, high, signal, on
a working board and a busted one. If I found something different,
I'd swap the chips and see if that fixed it. This has worked a couple
times for me. At least pull the chips out of it, they don't take up
much space.

It doesn't on my XEGS (which has been upgraded to 1MB). It stopped I guess just when the game is supposed to start. Do you do something funny with $D301??

I would say it is the 1Mb upgrade that has to do something funny with $D301.....! (as far as I know there aren't enough bits left there to select that much memory in the same way as a standard 130xe). Do you have any documentation on how this or other 3rd party memory upgrades is supposed to be used....or links, anyone..? No promises, but maybe they can be detected and dealt with properly then.

Also, I have no idea about the XEGS. Are there any subtle differences between coding it and other XE series?

Thanks
Chris

Hello,

I use that program with my Atari Hades060 with no problems. I have also made some DI Mega files along with some other DI files that auto-boot. These are mostly games, so if you need or want any let me know or else go to the site: http://homepages.paradise.net.nz/atari/. I uploaded all of my Mega DI files to this guy. They are complete with descriptions. I also wrote an article that is online: http://www.gooddealgames.com/articles/Atari_800XLDJ.htm.

Now for your problem. I believe 800XLDJ needs a multi-tasking environment, I use it under Magic. I know it bombs under Geneva and I think under plain TOS. I have not tried it under Mint, but I am sure it should work. The Falcon version is only for the Falcon and also bombs on my Hades. If this does not help, email me and we can get things straightened out.

Has anyone got a CAS image to work with a real Atari? I've got a cassette image that works with the new Atari800Win Plus 3.0 emulator, so I pulled out my 130XE to try and load it using APE and I just can't get it to work! I start the XE with Option-Start and roll the tape in Ape. After about 10-15 seconds I get a boot error. Any ideas?

Dominik

Ah, thanks. I plan on trying out some of the newer multitasking stuff
for the TT, but haven't gotten around to it yet, so that may well be the
problem.

Andreas Magenheimer is putting together a nice list of information about memory upgrades. Part (or all) of it might be in Michael Current's FAQ. I'm not sure if the info about my upgrade has been corrected yet.

Testing doesn't seem to be too hard. If you want to, I can ask Lee (who doesn't want his last name mentioned on a newsgroup) if he has one of the routines MyDOS uses (it seems to be a great routine) in a format that you can use.

Sure $D301 has enough bits to select 1MB. My upgrade does so. And doesn't even loose separate ANTIC and CPU access. What I do is check bits 4 and 5. If either or both are zero, the BASIC, OS ROM, SelfTest and in the XEGS Missile Command enable lines are frozen (a flipflop makes sure there status doesn't change during this period), while their bits can be used to select memory. That's 4 bits plus the 2 bits the 130XE uses already makes 6 bits. 6 bits is all you need for 64 banks of 16kB totalling 1MB. As soon as bits 4 and 5 are both ONE again, you can change the status of the ROM(s) (BASIC, OS, SelfTest, Missile Command).

On Wed, 17 Apr 2002 19:59:22 +0100, IAN MCDOWELL wrote:
> Thanks for that hias,thats very helpful
> I have checked the pin and its 0.20v is that good,

No, actually that's not good.

> how do i test to see if a
> resistor is broken,and where is capacitor i should test.

Here's a short checklist:

* Power down your Atari and, with POKEY fully plugged into the
socket check the following things (put your multimeter into
"resistance" mode)
- locate R84 and measure the resistance - it should be 4.7k
- try to find out which end of R84 is connected with POKEY pin 28
and which end is connected with +5V.
- Measure the resistance between POKEY pin 28 and both ends of
R84. The resistance should be ~0-10 ohm at the end connected with
POKEY and ~4.7k at the end connected with +5V.
- Remember which end of R84 was connected with POKEY and which end
with +5V
- Check the resistance between the end of R84 connected with +5V
and POKEY pin 17 (that's the +5V input), it should be some
~0-10 ohm.
- locate R131 and check it's resistance - should be 100 ohm
- measure the resistance between POKEY pin 28 and DATA OUT on the
SIO connector - it should be ~100 ohm

* Remove POKEY from the socket and carefully bend up pin 28. You only
need to bend it up a little bit, so that it will just not plug into
the socket when you re-seat POKEY. Don't bend too much (some 30 or
at most 45 degrees angle should do), otherwise the pin could break!

* Plug POKEY into it's socket so that all pins except pin 28 are
well seated into the socket.

* Power up your Atari, put your multimeter into "DC voltage" mode,
and check these voltages:
- The end of R84 connected with +5V should be ~5V
- The end of R84 connected with POKEY should also be ~5V
- Both ends of R131 should be at ~5V, too
- And, finally, DATA OUT on your SIO connector should also be at ~5V.

Please do the tests in the described order, and post which checks
failed. I'll then consult my magical crystal sphere and tell you
what's going wrong :-)

so long,

Hias

(again, here's the important part of the schamatics)

That i assume would be the 'Amiga One', which is running about 12 months late from its original roll out.

Basicly a PPC motherboard with industry standard expantions etc that you can connect a 1200 to in order to access the original chipset.

There is in fact a race underway to establish a PPC-based computer
that runs Amiga software. On the one hand is the Pegasos computer,
manufactured by bPlan. The Pegasos runs a unique operating environment
known as MorphOS, which allows Amiga (68K) software to be run on a PPC
processor. The Pegasos/MorphOS project is created by longtime Amiga
users/vendors who made and marketed a variety of accelerators during
the mid to late 1990's.

The other entry is corporate sponsored, receiving official Amiga Inc.
branding. Amiga Inc. is a Snoqualmie WA based marketing and licensing
company. They own the trademark "Amiga" but outsource the production
of this PPC project to Hyperion (software) and a variety of
hardware-oriented firms including Eyetech.

The Pegasos/MorphOS machine was first publically demonstrated last
year. Amiga Inc. have not demonstrated a working machine, but have
made a series of exciting marketing announcements. A senior employee
of Amiga Inc. recently threatened legal action against bPlan/MorphOS,
who maintain their solution is 100% legal.

Mathy quoted Amiga Inc.'s URL above. The URL for MorphOS is
http://www.morphos.de (there is a link to the bPlan website too.)

I have been following this stuff pretty closely and I believe the
Pegasos/MorphOS machine is the real deal, and that it represents a
genuine, modern alternative computer platform. But make up your own
minds. This is all very relevant to us Atari 8bitters, because the
late Jay Miner was the "father" of the Amiga, as well as the Atari
8bit.

Thanks for the info and referrences. I hadn't realised the upgrade was your
design - you have a very cunning mechanism for switching there, and I meant
no offence when suggesting it was strange!
If I understand you correctly (had to read several times!).....
Because I load the graphics into a ram bank with the OS on, and the game
tries to that bank with the OS off,
with your system that is not the same bank, although it would be on an 130xe
(or compy or rambo). I therefore need to switch the OS off during loading.
If I have made wrong assumptions here, then if your friend Lee doesn't mind,
I would be glad of further assistance!

Thanks
Chris

Well...

What Bill McEwen who runs Amiga Inc. said a couple years ago when he decided to focus on leveraging the Amiga trademark to develop games for handheld devices was that "Microsoft has won the battle for the desktop" but I always thought he was wrong. Microsoft has only won the desktop of the present, they have not won the future. And that is how I feel about it.

I'll stick to the system I know and describe Pegasos/MorphOS. What they have done in creating this PPC system is unique. Because unlike an unheard-of computer from Planet X, it has the advantage of being able to run the existing Amiga software library. You don't start from scratch with two programs in your catalog, you revive the stuff that has limped along for so long. Additionally there is specific MorphOS software that makes no compromise with the past, ie. developers don't have to code in 68K, they can code PPC.

I guess I do not think they will be a "major player in the PC market," how do you put a dent in something like that, but I believe they can be successful.

the PC market?

2348. SIO Connector Details Needed

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-18 23:45:22 UTC
From: Gary Morton <gary@alma.demon.co.uk>
Message-ID: <3CBF5B03.545C7225@alma.demon.co.uk>
Source record: 29868

Dear Atari Experts,

Is there any information available which gives physical information about the SIO socket which goes on the PCB of Atari circuits?

A friend is laying out a PCB for me and has asked for details so that he can make a PCB shape up for the connector.

I plan to use two connectors in the usual Atari style so that the circuit can go anywhere in the daisychain. One thing I'm not too familiar with is how does the chain work, or which pins of connector #1 connect to which pins of connector #2. Are there any schematics of Atari products which illusrtate this? I have a couple of sockets which were desoldered from a Atari printer/plotter. A circuit diagram of this product would be most useful.

thanks...

It is an 'always' = 'omni' available machine language monitor which allows you to check the status of memory and registers. One entry method is 'Select' + 'Reset' when the Omnimon OS has been selected by that switch. You can use it to disassemble 6502 code, change memory, read and write disk sectors or files, search memory for data, execute specific memory, etc. It is a very powerful tool.

The command syntaxis probably posted somewhere.

I use a simple program called cas2wav.exe that converts the cas into a wav file which can be recorded on a tape from your soundcards output. Seems to work 90% of the time.
Do a google search on wav2cas atari and you should find it, if not I can email it to you.

Omnimon is a part of the OSNXL/XE OS. See other messages for Omnimon operation. Omnimon is only 6k of the 16K of code. There's 8K of actual OS code and 2K of (Fastchip) floating point code. The OS was done by me. The Omnimon code was done by (Charles) David Young and the Fastchip floating point code was done by Charles Marslett (also the original author of Mydos). Flipping the switch should actually swith the whole OS from the original to the OSNXE OS. A backwards compatible OS based on the original OSN for the 400/800.

Hello,
I am in need of a program called Bug/65. I have Mac/65 and it was
supposed to be on the same disk, but it isn't. Also, I heard of something
called the Mac/65 toolkit. Anyone know anything about this?

Please reply directly to me at J70141@hotmail.com, I do not read newsgroups
very often.

Thanks

J70141@hotmail.com

Shawn,
Don't know of a good way to test all the banks out easily. Certainly don't assume my game demo proves a fault with your machine. Maybe your 130xe has a massive ram expansion already like Mathy's! Mathy seems to know a lot about this with ramdisk and MyDos. Someone must know a good way to check it out properly.

Chris

OOOOOOoooo. You have a Omnimon.
Now you can be a super hacker/programmer/mathingy.
With Omnimon, you hit SELECT-RESET and enter the machine
language monitor.
Most notably, you can dump a game cart to sectors on a disk.
Then figure a way to get the sectors to a file, then you can disassemble
the cart and figure out the copy protection (where it writes to RAM
and changes a value, instead of the value staying the same, indicating
RAM instead of ROM.) And WAALA, you got a cracked file
of a cart.
If you really are into machine language, you can change values in mem,
start execution anywhere, and stuff like that. Also, it is pretty much
an 800 OS, so you can use it instead of a translator disk for those
games that won't run on a XL/XE.
Stuff like that.
I have a copy of the commands written out somewhere, but it is
a little hard to figure out without the complete documentation, which
somebody proably has someplace on the net.
Congradulations!
Russg

Welcome!

Below You find Official Invitation for real Atari Copy Party. Please spread this info to all Your Frends! If you are not certain to come, ask Mr.Bacardi how him oneself pleased year ago!
I have hope, that will write he a couple of words on theme of rally on comp.sys.atari :)

Photos from People's Summer 2001 -> www.atari8.prv.pl/lato2001
Photos from Last Party 2001 -> www.atari8.prv.pl/last2001

If you want to be informed about all novelties, send empty e-mail under address:
vasco3@poczta.fm?subject=People's_Summer_2002_-_English_Info

Greetings!

Vasco/Tristesse - organizer!

- -

Lato Ludzikow (People's Summer) 4 - ATARI XL/XE, ST, Falcon Copy Party
August, the 2nd-4th, 2oo2 - Taklamakan, Opalenica, Poland
Invitation
- -

What everyone guest has to know...

It's fourth edition of this party, and (both with winter 'Last Party') it is ninth party in this place allready! Sincethe famous QuaST party has dead, parties in Opalenica ('Last Party' on December & 'LL' at summer) became the most important Polish Atari fans party. It's dedicated to all Atari users: ST, ST(e), TT, Falcon, and of course XL/XE.
I must notice, that it is NOT a commercial party. No one will get a profit of making a party. A money, you will pay for enter, is only for renting a place and for praizes.

Yes, but what is the cost of it?

We live in a kapitalistic country, and no one will give as a place for free. That's why we have to pay 40 zl (it's about 20 DM, I think, that is not much for people from western Europe). We know, that (for a difference) a trip will be very expensive for people from ex-communist countries, that's why, if you are from: Czech, Slovakia, or ex-USSR (like Latvia, for example), you may enter FOR FREE!!! You can bring a good beer for organizer if you want. Of course (because we are not feminists) women always enter for free! So You can take your girl/wife with You with a not much cost.

When?

Party will be at the first weekend of August (just like the QuaST party). It means from the 2rd (Friday) to the 4th (Sunday). Official opening will be on Friday, but You can arrive on Thursday's afternoon - party place will be open, and some people will be there allready, I think. Official closing is on Sunday about noon, but You can stay on party place to the late afternoon.

Where I have to go?

As it was said, this party takes place in Poland (Poland is in Europe, betweem Russia and Germany, if you are not good in Geography ;-). A small city - Opalenica is at west from Poznan city (Posen), near west border of our country. All trains (without Express, IC, EC) from Frankfurt/Oder (Germany) to Posen are going through Opalenica (just look for yellow train station).
Party place is (as always) in City Culture Hause, called 'Taklamakan'. How to get there from the station? It's about 800 meters long walk. You should go along by 'Dworcowa' street. At it's end (where is railway crossing at left), turn right to the '5-go>Stycznia' street. At next crossroads turn to 'Powstanca Kozaka" st. Walk ahead 100 meters and turn right to 'Farna' st. At it's enf you will see city-hall. Then turn right, and left to 'Mickiewicza' st. About 50 meters later You will see so long awaited 'Taklamakan'. Hurra!
If You think, that's a bit complicated, I have a good information. Probably always someone will wait for You at railway station!

What should I expect at this Takla...?
* A big show-hall where You can put your hardware (or see others' one). This hall has a big scene for Atari Scene ;-).
* A separate sleeping-room.
* A pizzery in the same building.
* A shower (wow, great!).
* And (the most important!) a lot of famous Atarians! And great Atari hardware.

You can also expect competitions (music, graphic, intro & demo). Bring your own production to participate in competitions!

You should not expect a comfortable beds, so take your own sleeping-bag! You

may take your hardware (don't forget about monitor, cables, etc). Probably we will also make a camp-fire one night (yes! in the city!) to roast some sausage and talk to the morning.

Competition rules (XL/XE)

Some general notes:
- There's have to be not less that 3 works to make the competition.
- In the case of very many productions organizers will do a selection.
- A compo-work has to be described in DOC file (a kind of competition, name of work, author(s), adress).
- Author don't have to be on party (it means, that You can bring your

friend's production if he can't arrive), but in this case author will not get the prize (if he win of course!).
- All competiton works are freeware!
- All participans will be in Jury.

Music compo:

- Plaing time is 3 minutes max. Longer tracks will be turned off.
- It must be your original composition (it means: no 'convertions', no 'covers'!!!).
- You can use someone elses' samples or synthwaves, but You should describe this in DOC file.
- Track must not be a *.COM file!
- Allowed formats (composers):
- Chaos Music Composer (CMC),
- Music ProTracker (MPT, MD1, MD2 + SMP),
- Theta Music Composer (TMC).
- All tracks will be played with MacGyver's Mega Player 1.6 or 2.1.
- Music will be played in stereo!
- Music can be in other format, if you bring a player & composer, and organizer will agree! (Using extra memory for music compo is not allowed!).

MOD compo:

- Only *.MOD format (known from Amiga 500).
- Max module length 170 KB.
- One sample may be 32 KB, rest only 16 KB.
- Tracks will be replayed with Inertia Player 4.1/4.12/4.5.
- Tracks will be replayed with 4-channels 8-bits music card (freq. 11.5 kHz).

Graphics compo

- Allowed formats: MIC, PIC, GR8, GR9, CPR, INP, INT, XLP, CIN, HIP.
- Another formats may be allowed if the painting program is available for every one (for example PGR) - but organizer has to agree.
- Converting from other computers and scannings are not allowed. Picture must be done on Atari!
- Redrawing someone else's pictures is not allowed! It must your original work!

Intro 256 B compo

- Maximum length of code is 256 bytes, but one dos header and one run/init vector will be not included in counting.
- Intro must not use extra ram (it must run on 64 KB mashines).
- Intro must run from DOS (MemLo not higher than $2000), but it doesn't have to back to DOS.
- Sound (if someone can put a music into) will be in stereo.

Intro 16 KB compo

- Maximum lenght of file is 16 KB.
- Intro must run on 64 KB mashines.
- Intro must run from DOS (MemLo not higher than $2000), but it doesn't have to back to DOS.
- Sound will be in stereo.

Demo compo

- There is no limit of maximum lenght.
- Demo must run with DOS (MemLo not higher than $2000), but it doesn't have to back to DOS.
- All callings to disk must be with 'D:' device only (not 'D1:' !!!) - it's because it must run from subdirectory and/or HDD.
- If demo has some effects during loading, it must not use RAM under FPP area - it's because it must run from HDD.
- Demo can use 320 KB of memory on PortB (+256 KB). It cannot use separatelly acces for Antic/CPU (like 130XE or Compy Shop). It means both Antic & CPU must use ramdisk together (another explanation: an acces like: Antic - extra ram & CPU - base ram is not allowed) That's because demo must run on every kind of RAM upgrade.
- Another RAM upgrades are not allowed to use on competition.
- There must be an option to change used memory banks! It should be a kind of setup with all possible 64 banks to select!!!
- Sound will be in stereo.

Ending words

I'm waiting for You! Come to keep Atari scene alive!

Hello Lance,
Ninja is nice, but not as nice as Karateka and far away from World karate.
It is more like a sort of a Jump & Run game. Collect one special item on every level (a lamp or so) and from time to time fight the enemies. but it is quite simple, because you can always leave a screen and come back to it with new weapons and new enemies. Solved the whole game in less than an hour, after I checked out that I have to collect something.
Still, it has good music and the graphics aren`t that bad. My top karate/kung-fu/... games:

1) World Karate / Int. Karate
2) Karateka
3) Chop suey
4) Ninja
5) Ninja commando (you can solve the levels by only jumping!)
6) Ninja Master (oh my god, I cannot believe it is that bad!
Only frenesis is worse than this one)
Well, unfortunately "the last Ninja" is not avaiable for the A8 and KE-softs Techno Ninja does not count here (a TB Jump and Run & collect game) -Andreas.

Well,
there is at least one simple demo driver for both the CX50 and Video
Touch Pad !!
tested it with both devices and it worked, but it is only a basic demo
on how to use/program them (not a universal driver which can be used in
other programs). You press a key on the pad and the demo program shows a
number on screen, thats all. but since the program is very short, its
easy to understand and to write your own code or driver for any
purpose... (think the driver appeared in an american magazine, like
Compute, Antic or Analog, forgot which one...). Ok, I have that VCS
paddriver on my "Drivers" disk which includes drivers for ST+Amiga Mice,
trackball, joystick, Paddles, Lightgun, Lightpen, CX85, Touch Tablet,
Koala Pad and maybe other devices...

As always: e-mail me to get this driver on 2 medium/enhanced disk sides
with dozens of other drivers (you might / might not need). ATR or XFD;
-Andreas.

It could even easier then that. Just do the consol key reset thing and then hit 'B for 'boot disk' with a DOS disk in your drive.

You could boot to DOS with every cartridge available and then just save the cart address space. It helped if you took the trouble to find the load and initiate vectors too.

You still needed to lower RAMTOP before running the file to be safe. I had just a little ~10ish byte program that I could use copy /a to to get the file to run first.

Well,
HIP originally stands for HARD interlace pictures; this means the
hungarian demo group HARD are the inventors (yep, its not hard to do a
hip pic, HARD are the inventors of this graphic format); Hip is
interlaced gr. 9+10 in greyscales; you get approx. 30 greys in a
resolution of 160x200 pixels... Nice, isn`t it ?!?
Try raphaels espino`s JPEG converter to convert JPG pics to HIP format.
Next, use the "Hip viewer" by Macgyver or "Visage2 by Madteam to view
these HIP pics (or any other HIP viewer, there are more than these...)
-Andreas.

P.S.: It is sad that this "bug" which gives us a higher resolution
appears in gr. mode 10 - thus colored HIPS, named RIP pics have 16x9
colors; it would have been nicer if the "bug" appeared in Gr. 11 cause
we then would have 16x16 colors in 160x200 or even 160x238 pixels...

Well, the CAS format existed before it was supported by those tools,
so it is supposed to work on a real Atari. Do ATR images work in your
APE setup? This would verify that your cable is working and that you
have the correct COM port configured.
Ape shows you the amount of time the leader takes. The Atari will
need approximately 15 seconds of leader. If your CAS file indeed has
a leader of 15 seconds, hit the return key on your Atari and
immediately click the play button in APE. Experiment a bit with this
timing. Do you hear the familiar cassette sound when APE sends the
first data block?
I know this stuff works, it took me hundreds of hours to write the
stuff and experiment with it. It took Steve a lot of time to add
support for it too. If you get the boot error within 10 seconds, then
it cannot be a timeout, so it sounds like the first record is just not
received properly. Sometimes this is due to incorrect timing for
hitting the play button/return key.

Keep those XL's/XE's buzzing.
Ernest.

The keyboard controller, the video controller and the kids controller
are basically the same device. (Like that huge blue one...)
I once wrote an article for a magazine. Unfortunately, the magazine
closed down before it got a chance to get printed and published.
I did put the stuff on the Pooldisk Too, disk 2, in the directory
text/keyboard. Only 'problem' is that it was written in Dutch.
If you cannot get a copy, send me an E-mail and I will send you the
stuff in a zip-file or so. In Dutch. Anyway, the DLI assembler
listing should be not to hard to read.
I wrote a DLI routine in assembler that allows you to run a Basic
program to peek result values. The way you 'read' those controllers
is by programming the joystick ports for output. Then you scan the
key-matrix yourself. There is no easy peek to get the value.
The DLI takes care of the scanning and the remembering that the key
was pressed until you clear it again.
I will try posting it in alt.binaries.comp.atari8bit in a moment.
Let me know if you can figure it out or not.

Keep those XL's/XE's humming.
Ernest.

The PC market is on a downward spiral as the equipment has become a
commodity. But the new Amigas are not going to make much of an opposition.
The recent history of the ST clones has shown that, with prices far too high
for mass consumption - which I suspect the new Amigas will suffer from.

The challenge today is to produce a range of home micros that are powerful,
easy to use and above all ... CHEAP. There is some room left for a credible
competitor to the PC (should have been Apple, but ...). A sub-GBP300 home
computer (a la ST and Amiga in their heyday) is a possibility but only if
one manufacturer develops and manufactures a system from scratch. The cost
of outsourcing components these days would be a bigger problem than in the
past.

A low-cost G3 or G4 system would give the PC a run for its money, but Motorola's pricing on these parts would probably kill such a project before it started!

The only problem I can see with the Free IP core (and other similar 6502 cores) is timing. Hardware timing might be ok, but instruction timing would be off by some margin as they are not identical to the original 6502-series and its derivatives (they're actually slower than the originals). Having said that, this particular core has been simulated at speeds up to around 130Mhz!

Would be nice if the 6502 code could be dumped into a proper RISC architecture. Save me learning another assembler language.

Crystal Castles should be available on about any archive site in loadable
file format.

Desert Falcon can be found here: http://people.freenet.de/mrbacardi/
B&C also lists the cart on their page as available.

The later version of Mario Brothers I have never seen anywhere nor
do I know where it could be purchased. The converted 5200 version
can be found on most archive sites.

2381. HELP ME!! 130XE Memory self test only showing 40K

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-20 02:54:20 UTC
From: wiseguyusa@yahoo.com
Message-ID: <3cc0d64a.5862180@news.earthlink.net>
Source record: 29801

I have had my 130XE for years and I love it.

I bought Video Title Shop and can't get it to load or run.

It says it need at least 48K
The 130XE should have 128K of RAM.

I ran the built in test and it only counts 40K.

In BASIC I ran this command:

print FRE (0) and it gives me a value of 37902.

Where is the rest of my RAM?

Can I fix this somehow? or do I need to replace the 130XE?

All my other software runs fine including the CES "Swan" graphics Demo
which supposedly uses all 128K.

FWIW: The built in test doesn't test all of a 130XE memory. You also need to hold down the option key while booting to disable basic and show even the bottom 48k.

Don't know why they did it this way. Probably saving a buck/code by just testing the minimum amount of memory an Atari needs to boot.

That's a real bummer. Gotcha on that one, though .... bought in 1984 as an
'investment' after they stopped making them and one of the department stores
was getting rid of them cheaply. Still works.

Wish I'd been able to buy another. A friend did (he always had to have
whatever I had) but he sold it on a few years ago at the price he paid for
it new - GBP40.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

>
>Dominik

Well, the CAS format existed before it was supported by those tools,
so it is supposed to work on a real Atari. Do ATR images work in your
APE setup? This would verify that your cable is working and that you
have the correct COM port configured.
Ape shows you the amount of time the leader takes. The Atari will
need approximately 15 seconds of leader. If your CAS file indeed has
a leader of 15 seconds, hit the return key on your Atari and
immediately click the play button in APE. Experiment a bit with this
timing. Do you hear the familiar cassette sound when APE sends the
first data block?
I know this stuff works, it took me hundreds of hours to write the
stuff and experiment with it. It took Steve a lot of time to add
support for it too. If you get the boot error within 10 seconds, then
it cannot be a timeout, so it sounds like the first record is just not
received properly. Sometimes this is due to incorrect timing for
hitting the play button/return key.

Keep those XL's/XE's buzzing.
Ernest.

Actually, I have talked to Jeri, the creator of the CommodoreOne, and she says that she is working on an Atari board in parallel that will come out later. I don't have many details and it is most likely years out, but she says that she has already borrowed video modes from other computers, like the A8, for the graphics on the C=64 board. We should give her as much support as possible.

Source record: 29816

The ATRs and the HD emulation works just fine with APE and my 130XE. I'll have to hook it up again and check if I gave the tape enough lead time. The problem is that when I did it I did not hear the cassette loading sounds from the XE. All I could hear is some slight buzzing from the sound output. There is no pilot tone or data signals when the program starts to load (is there supposed to be?). I wonder if the type of SIO2PC cable could have something to do with it? Mine is a home made single chip version (DSR connection), but it works great with disk emulation. I guess it's not a big deal if I don't get the CAS image to work, as I only have one CAS file I would like to try loading. Thanks for all the info!

There are 'Note' and 'Point' functions in DOS that basically implement
your fpos and fseek C type functions.

However, the 'Point' under Atari DOS 2.x isn't as nice as it is under
SpartaDos. The Point function in Atari DOS 2.x actually has to read
from the beginning of a file until it gets to the byte you specified in
the point command. SpartaDos will actually just skip to the point in
the file, making random access retrieval much faster.

Telling you the above doesn't get your problem solved, however. I think
that these functions are implemented as XIO commands. I used them all
the time using Action!, but I don't know what syntax it would take for
you to call them in cc65. Sorry.

Honestly, it seem like programming something to act like a 6502 which, really, is not that different than what I proposed when you consider it. Just a different choice of silicon , programming language, and implementation. I imagine that you are as comfortable and familiar with your choice as I am with mine. It's all strictly and intellectual exercise anyway, isn't it? I know that my life is plenty full of projects and obligations that it's not something I anticipate involving myself with any time soon. I've got all the gum I can chew right now, thanks. <g>

Hi Kenneth

| >| I have nothing but praise for Bravo Sierra!
| >
| >You've obviously not suffered much of that brain damaged idiots spam.
|
| I guess most off us find all the complaints to his posts just as
| offending. The same goes for those who can't keep there fingers off the
| keybord when reading Mr Sinclap's posts.

Do assholes like you complain when you have a problem with for example
something you bought, or do you keep quiet in case you upset the shop
assistant. Bollox!! you go the the shop and complain, so why shouldnt i
complain in these circumstances.

| Who's brain is most damaged, the spammer/troll or he who responds to
| those posts in public?

Have you ever tried using 'The force' to respond, it dont work so a public
response is the only answer.

| Follow-up set to comp.sys.atari.st,comp.sys.atari.8bit although I see
| very little reason to add anything to this particular thread...

How about, please dont spam this base with commercial advertising Mr. Bravo
Sierra you butt poker.

| --
| Kenneth Medin <kennethm@tripnet.se>

Ive taken the liberty of signing you up for some commercial spam from a few
of the larger 'purveyors', is that OK by you.

The standard is to TRAP linenumber before reading input.
PEEKing (195) for a 136 error means end of file.
At which point you close the channel and send what data you have back to the program.

Fseek in atari is Note and Point. Returns/uses Sector and Byte using an open IOCB. Point needs to be used in Update mode.

Print Fre(0) show exactly. The amount of free memory when using BASIC.
The other 27634 bytes is used by DOS, Basic rom, the O.S. and the hardware
addressing areas. The value you got is normal.

Under the self test, 40K is right if the Basic rom is not switched out
when booting. I don't remember if it checked the extra 64K bank.

The sockets are wired in parallel. Pin 1 to Pin 1, etc.

I have always just measured the pin spacing and created a shape from
circuit pads.

And make sure you have a source for the connectors, you may need to use 1/2
an SIO cable instead.

Do you ever think the appropriate thing for you to do would be to kill file everyone and everything you don't like vs flame? It saves a lot of time.

BTW: The financial structure of the internet has changed in the USA. Where as in 1990 you possibly could have complained to Ben's ISP, what he is doing now is perfectly legal if it doesn't violate his TOS with his ISP. This is part of the legislation Al Gore pushed through congress that people wrongly attribute him to saying he "created the internet" vs. "took the legislative lead in congress".

I don't like all the spam, porn, MMF, ad nauseum myself, but the commercialization of the net was exactly what the policos wanted to do and attribute that to the growth of the net. Ben's stuff is really harmless: He uses the same ID and doesn't try to hide behind phony names or defeat filters.

C is not my forte, so the coding is beyond me.

The Atari CIO returns an error 136 whenever you attempt to read past the end of file; a status code of '3' indicates 'next is EOF'. It means you just read the next to last byte and you next read will be the final one before an error 136.

Many of those mega images do not contain Dos.Sys for booting the system; you will need either a boot loader in drive 1 for game images in drive 2 or to boot with a MyDos .ATR in drive 1 and then swap to the mega image in any drive you like. Only MyDos or other large capacity system like Sparta can use the mega images; 2.0/2.5 cannot handle them.

It does, but if you want a test then try enabling AGP video memory and
'wait for blit' (if you have an AGP card) and see if you get a speed
loss.

Seems to be one of the 'delights' of XP..

>Dominik

If data records are received properly, all you should hear are the 2.2
second buzz tones of those records received as serial data.
The type of SIO2PC or APE cable should not matter at all.
Since the recorder is normally a stereo deck, you can hear the FSK
stuff with a real Atari tape recorder if the tape is recorded mono, or
if channel separation is not what it is supposed to be. Either way,
you will hear the leader beep.
Not so with APE or the CAS2SIO program, since no audio is sent to the
Atari. It makes timing harder. That is why it is nice to see the
time of the leader in APE, so you can compensate by pressing return
earlier or later. If the leader is to short, simply press return a
bit early, maybe even before starting the image on APE.
I downloaded the CAS file from alt.binaries.comp.atari8bit a few days
ago, and finally got it to load in Atari800WinPlus. I did not realize
that you had to wait for a few seconds after pressing return, and the
emulator did not make a buzzing sound either. Finally I got it to
work. The sound program made me feel real good.
It made me realize that this was only possible because so many people
started supporting the cassette and sharing their stuff.
Thanks to all of you!!

Keep those XL's/XE's buzzing.
Ernest.

2424. ATARI 130XE problems

Source record: 29845

I have an ATARI 130 XE with Oldrunner & 16K Bibomon.

Worked great some years ago but now it crashes after running 30 min ,
sometimes doesnï¿½t work at all.

The problem is that Iï¿½ve started a big game project on the 130XE (RPG)
but now I canï¿½t use this system anymore.

I still have several 64K machines , but I need 128K.

Problem is that I didnï¿½t upgrade the 130XE myself , I traded it for
something and there is so much hardware in it that itï¿½s difficult to
find out what is defective.

Atari did later produce a 130XE OS that contains a memory test routine that checks all 128K RAM and an updated keyboard test that matches the keyboard layout of the 130XE.

Problem is if you operate some of the cable TV marquee programs, there was one that doesn't work with this OS. Probably used an illegal OS call.

Hmm, that would mean you switch the OS back on without leaving the RAMdisk.
If you leave the RAMdisk, then switch the OS, then go back in, everything
should work just fine. On all machines.

I'll ask Lee if he can send you some source code then.

From: Mathy van Nisselroy <nisse-ma@reze-1.rz.rwth-aachen.de>
Message-ID: <aa0sjcolk1@nets3.rz.RWTH-Aachen.DE>
Source record: 29707

Howdy folks

I tried to use my XEP80 with MyDOS this weekend, but it looks like the XEP80 handlers I have won't work with anything but DOS 2.5 (atleast not with MyDOS).

Am I doing something wrong or....

BTW I noticed that if you put two monitors real close together and switch both on, the screen on both will nervously move up and down on both. I guess they influence each others CRT.

Maybe I killed on of my XEP80's by plugging the adaptor into the XEP80 while the adaptor was plugged into the extension cord (switched on). Grrr..... Don't try this at home.

For those with a need for lot's of screens connected to one Atari, how about this, plug one XEP80 into joystick port 1 and an other in port 2. Then again, since the XEP80 only uses 2 of the 4 pins that can be used for output, you could build a small circuit that would redirect the unused pins on the computer to the right pins on a second XEP80 on the same joystick port. :-))

2437. Where to find unmodified Joe Blade?

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-22 12:45:08 UTC
From: Dennis Debro <dnsdebro@netzero.net>
Message-ID: <xyTw8.162368$gA5.12589062@e3500-atl2.usenetserver.com>
Source record: 29708

I was looking into modifying Joe Blade to play on an NTSC 8-bit but the only versions I can find have been modified by Joe A (what's displayed when you start the game). The game crashes occasionally and I don't know if it is because of the modification that had been done or if it was in the original game. I also have no idea what the original modifier did to the code because I can't find any notes.

Does anyone know where I can find an unmodified version of Joe Blade or at least know what the programmer did in the modification?

2438. Re: cc65 file i/o functions

(How tell eof in cc65.)
I don't know cc65 very well. But you can tell eof by an error
136. If you use assembler, I think 136 will be in the Y register
after a CIOV call. BASIC returns the 136 error.

If considering your way of bashing the original poster turns a person
into an asshole, you can count me in there then...

This newsgroup is certainly not flooded with commercial postings, so I
don't have a big problem with it. If I OTOH were to react every time a
disrespectful posting is seen, I'd have my hands full complaining. I
guess we all have to let some things pass.. ..and at least try to be
nice. If not, I don't see any reason to stay around really.

Hi,

> From missing cart list
>....
> 8,192 gridrunner.rom

Not surprised THAT one is missing since it wasn't released on cartridge....in fact it was the first game I ever bought for my Atari and it came out on cassette.

May still have it somewhere.

TTFN - Pete.

Source record: 29713

Well,
on the real Atari we had Tapes. when copied to disk (without
hacking/cracking) they were called .CAS and could be used with a
so-called C-simulator. there were several of these C-Simulators avaiable
here in europe. there are even some Gamedos versions which can load
single stage cass. files (eg. Micro DOS II initializer by Stefan
Dorndorf). but remember: most of those CSIMs only work in Single or
Enhanced density (128 Bytes per Sector)... -Andreas.

P.S.: Ofcourse the hackers mostly created normal *.COM files instead of
annoying CSIM *.CAS Files...

2443. RD info updated...

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-22 19:47:41 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CC468DD.7DBBD5DC@students.uni-mainz.de>
Source record: 29714

Hello Atarians, hello Michael Current,
once again here is a "small" update of the Atari Ramdisk overview.
Why do I send the whole text again, instead of the update only?
Well, simply because its easier to replace the whole text, than
updating dozens of things (Ramdisk table, missing RDs, thanks to,
etc.).
Ok, enough said. Let us start now - and update the A8FAQ as follows:

3.7 Atari Ramdisks - a short & very incomplete Overview:
(This is version 1.3 from April 2002)

Right from the start of the Atari 8-bit computer era in the late 70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM
extensions and enhancements, just to save some money. Also a lot of
firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This short and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to see
this text & info growing. For now let us start here, the info-section
is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the RD);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in
their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use
a small setup program to setup any kind of RD. Now let me begin:

3.7.1 Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k
RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 no authors known 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible,

- 4128k800 no authors known 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank, when RESET is pressed! A fix should be
available somewhere (I have been told, but I do not know where!);
whereas original Axlon Ramdisks homebank properly !!

- Mosaic unknown 64k C000-FFFF?
unknown unknown (CFFF) plug-in-board
Note: total memory = 96 kbytes, not Axlon compatible?;

- Mosaic unknown 128k C000-FFFF?
unknown unknown (CFFF) plug-in-board
Note: total memory = 160kbytes; not Axlon compatible?;

- ...

3.7.2 Atari XL/XE Ramdisks:

Due to an excellent article by John Picken, I`d like to present the
following overview first (found this info at Jindroush`s homepage):

RAM BANK ACCESS TABLE 64-1024K

PORTB Available on Type

E3,E7,EB,EF 1,2,3,4,5,6,7,8,9
C3,C7,CB,CF 2,3,4,5,6,7,8,9
A3,A7,AB,AF 2, 4,5,6,7
83,87,8B,8F 3,4,5,6,7
E1,E5,E9,ED 5,6,7
C1,C5,C9,CD 5,6,7 (short
A1,A5,A9,AD 5,6,7,8 overview)
81,85,89,8D 5,6,7,8
63,67,6B,6F 6,7
43,47,4B,4F 6,7
23,27,2B,2F 6,7
03,07,0B,0F 6,7
61,65,69,6D 7
41,45,49,4D 7
21,25,29,2D 7
01,05,09,0D 7

Type Upgrade Mapping
1 = 130 XE
2 = 256 XL Bucholz/Peterson/Rambo
3 = 256 XL Newell
4 = 320 XE Peterson
5 = 576 XE "
6 = 832 XE "
7 = 1088 XE "
8 = 832k+ " (BASIC on)
9 = 576 XE " " "

Note 1: The documentation by Scott Peterson on his upgrades indicates
that
only 128k is available in XE-compatible mode (Types 8/9 above). Two more
64k blocks are available as indicated with 832 or 1088k machines though
not
all RD handlers will find and use them.

Note 2: Based on an article by Jeff McWilliams in the April 1993 edition
of
AC, it appears the Newell 1-meg upgrade is mapped similarly to the
Peterson.

Note 3: With version 2.1 of the SpartaDOS Wedge, Ed Bachman describes a
simple fix for Peterson upgrades to reenable Antic access to extended
RAM.

It is definitely worth checking out, even if you don't use SpartaDOS.

Again thanks to John Picken for this information.
Now let`s continue with my own overview table (long overview):

Name Vendor Size
Area Bits Port
Banks
Notes

Note that PB4 is used in all Ramdisks by the CPU to access RAM or the
extra Ram/Ramdisk banks; when PB5 is unused, Antic may have RD access;

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte Chips (west), new=32kbyte Chips (east);
XEs made in China have faulty GTIAs => replace them!;
standard Atari ramdisk; Antic access: YES!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 81,85,89,8D,A1,A5,A9,AD,C1,C5,C9,CD,E1,E5,E9,ED;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes also a test program);
seems to be incompatible to most other 192k/256k Ramdisks (?);
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses PC-SIMMs (30-Pin-SIMMS), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS:Missile Command=YES!;
no use of any switches!; Antic access: YES!

- Megaram 1 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 16kbyte Chips x16 (very big/huge platine);
originally designed (and maybe produced?) by Ralf David,
older Compyshop version; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Megaram 2 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 64kbyte Chips x4 (much smaller platine);
originally designed (and maybe produced?) by Ralf David,
newer Compyshop version; fully compatible to Megaram 1;

Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
Compyshop`s Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four (or more?) switches; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: uses 64k as RAM and 192k as RD; Antic access: no!
NOT compatible to S.Peterson, C. Buchholz and Rambo XL Ramdisks;
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-70), if full 1MB is used,
then built-in Atari Basic is not avaiable; Antic access: no!
built in Atari Basic: no!, XL/XE Selftest: YES!

- Newell Patch by E.P. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-70), mod. by Erhard Puetz
(how?), full Basic and Selftest control; Antic access: no (?),
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)
Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F
20,21,22,23,24,25,26,27,28,29,2A,2B,2C,2D,2E,2F
40,41,42,43,44,45,46,47,48,49,4A,4B,4C,4D,4E,4F
60,61,62,63,64,65,66,67,68,69,6A,6B,6C,6D,6E,6F
80,81,82,83,84,85,86,87,88,89,8A,8B,8C,8D,8E,8F

A0,A1,A2,A3,A4,A5,A6,A7,A8,A9,AA,AB,AC,AD,AE,AF
C0,C1,C2,C3,C4,C5,C6,C7,C8,C9,CA,CB,CC,CD,CE,CF
E0,E1,E2,E3,E4,E5,E6,E7,E8,E9,EA,EB,EC,ED,EE,EF
Notes: uses 8 pc. 4Mx1 Chips (?); made by Newell, later by FTE;
seems to be very incompatible to existing software and bankswitching
cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is
NOT available (only extra Ram/Ramdisk banks); Antic access: no!
built in Atari Basic: no!, XL/XE Selftest: no (?)

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz/ICD 192k, not Newell compatible!;
uses 64k as RAM and 192k as Ramdisk; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson
256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still 64k RAM plus this 256k extra RAM;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF,
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF;
Notes: should be fully compatible to TOMS-Ramdisk (?);
Atari Basic: no!, XL/XE Selftest: YES!, Antic access: no!

- Peterson 1088k S.Peterson 1024k
4000-7FFF 1,2,3,5,6 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: fully compatible to Newell and TOMS - Ramdisks (?);
Atari Basic: no!, XL/XE Selftest: YES!, Antic access: no!

- Quarter-Mega-XL C.Buchholz 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to ICD/Peterson 192k, NOT Newell compatible!;
uses 64k as RAM and 192k as Ramdisk; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Rambo XL ICD 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz/Peterson, NOT Newell compatible!;
uses 64k as RAM and 192k as Ramdisk; Antic access: no!

built in Atari Basic: YES!, XL/XE Selftest: YES!

- missing info for the following Ramdisks:
Bob Wooley Ramdisks, 600XL Ramdisks, Rambo XL (512k by ICD),
some more Compyshop Ramdisks as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

3.7.3 PBI-devices (XL=parallel Bus, XE=cart. Port+ECI):

Name Vendor Size Area
Banks Bits Port Note

- no information yet!
- missing info for the following Ramdisks:
ICD MIO (256k, 1024k), Yorky XL (256k), Turbo-Freezer XL (256k),
the Atari 1090 (this one should also have had a 64k extra RAM
expansion card), R.David/K.Peters Romdisk (512k) and many many

other PBI devices...

3.7.4 other "Ramdisk" types and devices:

Name Vendor Size Area
Banks Bits Port Note

- no information yet !!
- missing info for the following types and devices:
Flashrom (512k), Ramcart (64, 128k), Rambox (64k-4096k), CP/M card
(with 64k extra RAM avaiable), ATR 8000 (also had 64k extra RAM),
Turbo 65816 (or 65801 / 65802), ARGS Romdisk cart. (64k) and many
other types...

For this third edition special thanks go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl and Ron Hamilton for
sharing their info with me. Also thanks to John Picken for writing an
excellent article about ramdisks and cartridges (especially about
bank-switching, which both devices can do). And thanks to Jindrich
Kubeck (Jindroush) for presenting this article on his homepage...
Thank you Folks !!
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or
other things that might help, let me know. Please do also send
corrections
(I am a novice in this subject, so there will be quite some updates and
corrections nescessary). Thank you - Andreas Magenheimer.

2444. another RD info text updated...

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-22 19:56:39 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CC46AF7.C4534A9D@students.uni-mainz.de>
Source record: 29715

Hello Atarians, hello Michael Current,
by the time I have also updated the text about software that requires a
Ramdisk.
Just 4-5 new entries, but worth reading. Here it is:

8.13 Atari programs which require extra Ram / Ramdisk:
(This is version 1.3 from April 2002)

The memory values given are not always fully correct, since I do not
have all kinds of memory settings or Ramdisk types. At the moment I
merely have machines with 64k, 128k and 320k memory. Thus I cannot
tell if a program may work with 192k or 256k (or more than 320k), since
I do not have such machines. Any help or correction is welcome...

8.13.1 non-Demo programs:

- The Wedge 2.x by Ed Bachman needs 128k memory (a 130XE is
enough; but: Antic must have RD access!!)
- Space Harrier by Speedy needs 128k memory (130XE is enough);
- The Works by Tom Hunt needs 128k minimum memory (supports
also bigger machines up to 256k, but no CS Ramdisks);
- T-34 by Mirage/ANG needs 128k memory (a 130XE is enough);
- Mister X by Power per Post needs 128k memory (130XE);
- Castle of Blackthorne by Thimo Graef needs 128k memory;
(a simple ripp-off of Dungeonmaster & Bardstale, written in
Turbo-Basic XL; unfinished and thus very limited playability);
- Gizmo`s Castle by Black Panther is avaiable in two versions:
the 64k version and the 128k version; if you have the 128k
version you will need a 130XE or compatible machine;
- Oelbaron by ??? (author unknown) also comes in two versions:
a 64k and a 128k version; a 130XE or comp. is needed for 128k;
- Boss-XE by Mirko Sobe needs 128k minimum memory (XE or bigger);
- Boss-X by Mirko Sobe needs 128k minimum memory (XE or bigger)
(works best with MyDOS 4.5x, supports Subdirs & Harddisks);
- ATOS the Mega-Multimedia GUI / Desktop by Tom Hunt requires
a 16Megabyte Harddisk partition or any XL/XE Atari with a
big Ramdisk (256k, 512k, 1024k) and/or a big Floppydrive (180k,
360k, 720k, 1440k densities); this mega-application will not
work on a non-expanded 64k Atari with only 810 or 1050 disk
drive; works best from Harddisk, should also work (slower)
from big floppies and/or big Ramdisks (untested yet);
- MTOS 1.0 and 1.1 by Tom Hunt need 128k memory (XE), there is

also a 256k version of MTOS (64k RAM + 192k RD; probably Newell?);
- Snapshot by ??? (author unknown) needs 128k minimum memory;
- XL2 by J.K. Picken needs 128k minimum memory; supports also
bigger XE-compatible machines of up to 1Megabyte (?);
- the CTH-Sound-Utility by Tom Hunt (a Wave+DIG Player) supports
64k, 128k, 256k, 576k and 1088k machines; uses 16k RAM+RD for the
Digi-Sound, thus a 64k machine (where only 16k can be used) is
much to small!; does not support 320k machines, nor Compyshop-RDs;
- Datei 4.0 and 4.1 by ??? (author unknown) both support 128k (XE)
and 320k (Compyshop) machines;
- various Filemanagers/Filecopiers support XE-comp. Ramdisks;
i.e. you need 2 drives if 48 or 64k RAM, only 1 drive + RD if
extra Ram / RD is avaiable (for example: Professionel Copy 1.x
and 2.x, Dos Control, Turbo-DOS Filecopy, the RAF-Commander,
Tight-Filecopy, TOMS Navigator, Spartados' The Browser, Spartados'
The Wedge 2.x, Spartados' Menu, Bewedos' Menu, etc.);
- various 130XE-test programs need 128k RAM, e.g. for bankswitching
tests and/or other things (can be found in many magazines);
- various System-test programs support 48k or 64k as well as extra
RAM; since they were (mostly) written to detect the extra RAM /
Ramdisk, you "should" have more than 48k or 64k memory...
(for example Sytem Info 2.x, System Test 1.x, Memory test, etc.);
- some XE-Sectorcopiers absolutely need a minimum of 128k RAM
(for example: XE-Copier, 130XE-Sectorcopy and many others);
- there are also some Tape programs (Tape-Disk-Copier, Tape-Tape
Copier, Disk-Tape-Copier, etc.) that need a minimum of 128k RAM,
for example VampireSofts 130XE Coolcopy and others;
- there are also some Tape-Ramdisk programs or drivers (which provide
a RD for the Tape users) that need 128k minimum memory;
- no more ideas...

8.13.2 Demo programs:

- Amiga Boink XE by ???, minimum 128k RAM; XE=yes, CS=yes;
- American Natives Demo by FOX-1, needs 256k RAM; XE=no, CS=yes,
AM=yes;
(any RD with min. of 192k should do - just use your own RD driver!)
- Asskicker by Shadows, minimum 128k RAM; XE=yes, CS=yes;
- Anime-4ever by ???, minimum 320k RAM; XE=no, CS=yes;
- Base33 by AIDS, minimum 320k RAM; has a RD-setup menu;
- Bill-Pie-Demo by ???, minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- BMW-Ani by Mirko Sobe, minimum 128k RAM; XE=yes, CS=yes;
- CES-Demos by XANTH (full version) needs 128k RAM; XE=yes, CS=yes;
- Cogito by AIDS, minimum 192k RAM; XE=no, CS=no;
- Comet-Demo by Madteam needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Danielle-Gr.9-Ani by Bill Kendrick has a length of 64kbytes and
therefore should load off of a RD or a Harddisk (a Floppy drive is

verrryy slowww); for a RD-machine 128k total memory is enough;
XE=yes, CS=yes; (any RD should do - use your own RD driver!)
- Edelweiss-Demo by A.R. & CSS needs minimum 320k RAM; XE=no, CS=yes;
(a 256k sound sample + a picture; the much better intro works
without any extra RAM and is also avaiable as a separate file);
- Ergo-Bibamus by Quasimodos, minimum 128k RAM; XE=yes, CS=yes;
- Glashead/HTPPD by AR+CSS, minimum 320k RAM; XE=no, CS=yes;
- Grafik+Sound-Demo by P.Sabath needs 128k memory; XE=yes, CS=yes;
(many different versions, there is also a 64k version avaiable;)
- Halle 1994B (Wormhole) by AR+CSS, needs 320k?; XE=no, CS=yes;
- (Atari) Hardware-Demo by AR+CSS, needs 320k RAM; XE=no, CS=yes;
- I.B.R.-Demo by MacGyver/AIDS, needs 256k RAM; has a RD-setup menu;
- Igor, Side A by Madteam needs 128k minimum RAM; XE=yes, CS=yes;
- Igor, side B by Madteam needs 192k minimum RAM; XE=no, CS=yes;
- Journey by Polynomials needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Khai-Et by AIDS needs 320k minimum RAM; XE=no, CS=yes;
- Killer-Whales by Madteam needs 320k minimum RAM; XE=no, CS=yes;
- Lajf-Demo by Madteam needs 128k memory; XE=yes, CS=yes;
- Megablast-Sounddemo by DGS needs 128k memory; XE=yes, CS=yes;
- Muppet-Movie by Madteam probably needs 128k memory?; XE=yes, CS=yes;
- Nascar-Ani by Mirko Sobe needs 128k memory; XE=yes, CS=yes;
- Nonejm by Tight (pre-release) needs 128k memory; XE=yes, CS=yes;
- Owca-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Owca-2 Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Parrot-X-Mas-Demo by A.Ramos needs 128k memory; XE=yes, CS=yes;
- Pedrokko-Parrot-Sounds (10 Disks / 20 Disksides by Pedrokko)
partially need 128k memory; XE=yes, CS=yes; (use your own
RD-driver!)
- Raving Vierpz by Pentagram needs 128k memory; XE=yes, CS=yes;
- Raytracing XE by K.Pelzer needs 128k memory; XE=yes, CS=yes;
(also known as "Landscape-XE" Demo or just "Landscape" Demo)
- Raytracing 320k by Elsni needs 320k memory; XE=no, CS=no, AM=yes;
(written in Turbo Basic - patch the listing for your own RD!)
- 1MB Raytracing-Demo by ??? needs 1088k memory; XE=no, CS=no, KP=yes;
(comes as a Bootdemo on 8 disksides; coded in Assembler...)
- Revenge of Hacker by Rasero Team needs 320k minimum RAM; XE=no,
CS=yes;
- Sweet Fantasy by Tight needs 128k memory?; XE=yes, CS=yes;
- Sheol by Bit Busters needs minimum 320k RAM; XE=no, CS=no; TO=yes;
- Shiny Bubbles by ??? needs 128k memory; XE=yes, CS=yes;
(there is also a shortened 64k RAM version avaiable);
- Stash-Demo by Rasero Team needs 320k minimum RAM; has a RD-setup
menu;
(first use B for manual choice, then again a) for TOMS or c) for any
other type of RD; do not use b) for Compyshop, since it is faulty!)
- Starwars-Demo by AR+CSS needs 320k minimum RAM; XE=no, CS=yes;
(always boot with Option pressed / Basic off, to avoid stripes...);
- Timekeep(er) by New Generation needs 320k RAM?; XE=no, CS=no;
TO=yes;

- Tit-Demo by Madteam needs minimum 256k RAM; has a RD-setup menu;
- Too-Hard-2 by Animkomials needs 128k memory; XE=yes, CS=yes;
- TheTop-3 by WFMH partially needs 128k memory; XE=yes, CS=yes;
- Total Dazed by Tight needs 128k memory; XE=yes, CS=yes;
- Trabant/HTPPD by AR+CSS needs minimum 320k RAM; XE=no, CS=yes;
- Trip6-Demo by Shadows needs 128k memory; XE=yes, CS=yes;
- Ultra by Taquart needs 128k memory; XE=yes, CS=yes;
- Vengeance by Excellent needs 128k memory; XE=yes, CS=yes;
- Vent by Exc.+Pent. needs 128k memory; XE=yes, CS=yes;
- Video Blitz by Helvetica Bold needs 128k memory; XE=yes, CS=no;
(Antic must have RD access, otherwise the Demo doesn`t work!);
- WAF-Demo, Side B by WAF members, two parts need 128k memory
(Raytracing Part and Vector Part); XE=yes, CS=yes;
- Worms-Demo by Datri needs 320k minimum RAM; XE=no, CS=no;
(on a XE or CS-RD you can see the ani with many bugs);
- X-Demo by Madteam needs 320k minimum RAM; has a RD-setup menu;
- X-Files Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by SAG needs 128k memory; XE=yes, CS=yes;
- Xyberscape-XE by Bill LeMasurier/TAF needs 128k memory; XE=yes,
CS=yes;
(there is also a 64k version avaiable separately);
- Zero-Demo by New Generation needs 128k memory; XE=yes, CS=yes;

Note: - XE means 130XE Ramdisk (size: 64k);
- CS means Compyshop Megaram 1 or 2 (size: 256k);
(schematics avaiable from ABBUC)
- AM means Atari Magazin Ramdisk (size: 256k);
(schematics can be found in AM 2/1987)
- KP means Klaus Peters Megaram 3 (size: 1024k);
(schematics avaiable from ABBUC)
- TO means TOMS Ramdisk (size 256k), this is
standard in Poland and compatible to S.Peterson;
- NE means Newell Ramdisk (size 256-1024k),
distributed by Newell Ind. and patched by users;
- RA means Rambo XL Ramdisk (size: 192k),
distributed by ICD and selfmade by users;
- SP means Scott Peterson Ramdisk (size 192-1024k),
where the 1MB version is Newell compatible;
- has a RD-SETUP menu means, that you have to hold
down SHIFT upon bootup to get the setup-menu; here
it should be possible to setup any XE-compatible RD;
- I could only test XE and CS Ramdisks, since
I do not have any other kind of RD;

Thats all so far. Any additions or corrections are welcome.
Greetings, Andreas Magenheimer.

I do that the same way I use a Mega-DI image. YOu do not boot the large
ATR file. First boot up the emulator using another ATR image (I like
MyDos). Then switch to the large ATR file and do a directory list and
boot the program (within the Mega ATR image) that you want.

Hi,

Send a mail to majordomo@musoftware.de with the text
"subscribe cc65" in the body of the mail to get on the list
and try posting the question there. Most Atari CC65
contributors would read this group too but you might
get a better response there.

Regards,

Mark

Mirko Sobe wrote

: How can I view HIP-Pictures in Turbo-BASIC?
: I want to write a viewer for pictures in HIP-format for using with BOSS-X
: (www.atarixle.de/boss)

There is a small MC routine (a binary named HIP.COM) floating around the net to view them. I used it in assembly and it works great. The routine does not have an ending but keeps looping (END JMP END). When editing the code and change those few bytes to RTS you can use it in your own program.

Normal use is like this:

In DOS, binary-load PICTURE.HIP
Then binary-load HIP.COM
and type RUN $xxxx <--- start-address of the viewer

As for TurboBASIC, you'll have to BLOAD the *.HIP into memory (exists of 2 memory-blocks), and then jump to the view-routine (X=USR...). The view-routine also has to be BLOADed into memory, prior, or after, but of-course before jumping to it :-))

One problem you may have is the place into memory where the *.HIP's will be loaded at default. Don't know from the head where they are located, so it may cause troubles with TurboBASIC. In your case (as TurboBASIC-master) it'll be no problem to relocate the pics to another place in RAM and modify the viewer-routine to let it "look" somewhere else in stead of the default *.HIP space...

One thing to take care of are the interrupt vectors since the viewer messes around with them and don't restore them. I always store the values of the normal VBI, extended VBI, DLI and DL to restore them properly after I return from the routine...

Mathy van Nisselroy wrote

: BTW I noticed that if you put two monitors real close together and switch
: both on, the screen on both will nervously move up and down on both. I
: guess they influence each others CRT.

Tell me. I have 4 in a row. The windows-screen on 21" PC monitor gets really colorfull when switching on one of the others. Switching on all of them shows a realtime plasma effect as never seen before in any demo :-))

: For those with a need for lot's of screens connected to one Atari, how about
: this, plug one XEP80 into joystick port 1 and an other in port 2.

Tried that a long time ago. Did even work (partially :-)

First I booted the standard driver-disk. Next I loaded an alternative driver with modified PIA code to use the other joystickport. Guess I ran into timing-problems since it would only display a few lines on both the screens...

More specifically, using MyDOS4.5 in drive 1 and the megaimage in drive 2 do the following-

Boot the atari and choose menu option O to configure a drive-
select drive 2, no to remove drive, yes to high capacity, yes to configurable. Size is 65535.
When that's done you then choose option P to set density type 2,S for drive 2 and single density.
You're all set, just type 2 at the menu to see the directory.

2454. Indus again

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-23 06:46:30 UTC
From: Jindrich Kubec <kubecj@asw.cz>
Message-ID: <3CC50345.FE6AA2BD@asw.cz>
Source record: 29725

Hi,

finally I got good power supply for Indus and tried to use it.

No problem, when using it with standard dos, but:

1) What are various msgs displayed? G4, G5, F9...
2) How to use maximal speed in SDX?

I tried to format disk in Ultra Skew, it switched automatically to
highspeed and formated till forever (tracknumber going from 0 to 39 many
times).

I also wrote config.sys (what a pain!) including 'device indus', but I
can't say I've seen any speedup (possibly because SDX uses highspeed
with Indus by defaul?)

What are the funny high beeps coming from the computer?

Some weeks ago I was reading through the ABBUC forum. In the thread
beginning with <http://www.abbuc.de/cgi3/messages/53.html> Tobias Arnold
scanned and OCRd the german manual of Bernhard Engl's Turbo-Freezer XL
and made it available at
<http://people.freenet.de/toarnold/tfreezerXL.html>.

A long time ago I had the Turbo Freezer XL and a 1050 Turbo enhanced
floppy drive (the cheapest way to attach a standard printer to your
Atari 800XL at that time).

Haven't followed this thread. What's it about ? I must say I have not anything to complain about concerning Bravo Sierra. Excellent guy, Ben. I have seen in the past someone complaining about his postings here, calling it spam, but I think we need more info on where to get stuff. I appreciate his appearances here, although I don't buy too much, I at least know where to look.

Keep it up Ben!

You can file a .dcm for jblade.dcm in the cth archive at ftp.spudster.org
and a .com joblade.com. in games/dcm/j and games/files/j.
They are not .pro images, so they are modified files. Maybe these
are the ones you're working with, having problems with.

2465. An improvement for my APE cable

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-23 17:37:19 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3cc59bcd$0$1416$1dc6e903@news.corecomm.net>
Source record: 29736

My APE cable is ok, but marginal. I think it is the length of it (8 feet)
and the small wires in my PC serial cable part.
I changed the 'out' line from pin 9 to pin 6, from RI to DSR.
Set APE for DSR and now things are much better.
I can do 2x speed, I can do 850 emulation and printer thru.
I can't do APE+ 3x speed, but before I could only do APE 1x
speed in 'Stupid' mode and even that had problems.
I guess most don't have any problems with theirs, maybe shorter
cable or something. This is a good improvement.
APETIME and REMOTE won't work if I boot from a real
drive, but do work if I boot from APE image.
Now, I gotta get a USB mouse and put my USB port card in
my trusty 486, so I can use APEwin98 (my PC PS/2 port crashes,
so I have to use one serial port for the mouse, the other for the
modem, no serial port for APE.)

The default SpX config has the DEVICE INDUS already in it.
If you make a config.sys, you gotta have DEVICE SIO before
the DEVICE INDUS.
According to the book, the default config.sys is:
DEVICE SPARTA OSRAM
DEVICE SIO
DEVICE ATARIDOS
DEVICE INDUS
DEVICE CLOCK
DEVICE JIFFY
DEVICE RAMDISK
The 'Tonk' sound coming from your computer is an error sound
from the Indus, every time you hear it, you'll get a message
in the Indus display.
You get errors with 'G', get error, 'P', put error, 'F', format error
or 'E-' no error, pushed the error button.The book only has
4 error numbers, but I've seen error numbers not in the book.
3=lost data can be 'G', 'P', or 'F'
4=Chksum error 'G' or 'P'
5=Record not found 'G' or 'P'
7=write protect error 'P' or 'F'
9=verify error 'P' or 'F'
If your Indus kept trying to format the disk, and getting 'F9' errors
it isn't being successful with the format.
I especially have high sector problems with read and write on my
Indus.
There were at least two flavors of Indus, one with a 1050 type
Tandon mech and another with a Chinnon mech.

Looks like a nice, standard, text adventure, but you mention 'rolling
hills' so it sounds like graphics.
Clayton Walnum made an 'Adventure Creator' program to make
text adventures with. It was called 'Adventurous Programming'
in ANALOG issues 39, 40 and 41. That's Feb., Mar., Apr. '86.
You can just download all of '86 from the CTH archive at
ftp.spudster.org in the ANALOGS directory. It may be a little
hard to figure how to use it, but the purpose of it was to make
adventure programming easy.
Cyberroach has a web-site on ANALOG, that might have the articles.

I don't think that is as big a problem as you might think. Around here
(in the USA), you can buy at computer shows, and some stores, a small
computer called the BookPC and BookPC II, which aren't much bigger than
a large book and have a pretty small MB. Actually, I think you can buy
these type of MB's by them self. They might be listed as
micro-motherboards
in hardware catalogs. They come in several flavors and are easily fast
enough to emulate an 8bit Atari. They would fit in a 400 or 800 case
with no problem, but probably not an XL/XE case.

Hi!

On 21 Apr 2002 17:28:12 -0700, Lord Chaos wrote:
> I have an ATARI 130 XE with Oldrunner & 16K Bibomon.
>
> Worked great some years ago but now it crashes after running 30 min ,
> sometimes doesnï¿½t work at all.

There are some very common problems:
1) contact problems due to oxidation or hardware extensions making
their way out of the socket(s) they are supposed to be plugged
into
2) thermal problems (eg. computer is only working when it is
cold)
3) a bad power supply (check with a replacement)
4) a bad solder pad (try re-soldering all pins)

The most probable problem is number 2 IMO (your Atari stopping to
work when it's warm) but check number 1 first (it's a lot faster
as you'll see). Before doing check number 2 you could also try
replacing the power supply if you've got another one. Then check
number 2, and number 4 at last.

ad 1)
Try re-seating all ICs of your Atari. This means: gently pull
them out of their sockets and plug them in again.
When you have pulled out an IC closely look at the pins of the
IC if they are still shiny metal. If they are dark, try cleaning
them. Also check if all the pins are straight and perfectly fit
into the socket. Once I had a problem with a 1050 randomly going
mad, and the cause was one pin of the ROM bent by 180ï¿½ half-way
down, so there was contact most of the time, but not always...

ad 2)
This means that one of your ICs has gone bad, and you'll have
to replace it. The complicated point is finding out which of the
ICs is bad.

First of all check if you've got a thermal problem at all.
Put your Atari into the fridge for one hour or so, and check if
it is OK. Then open your Atari and use a hair-dryer to warm
up the ICs until they are more than hand-warm and again check it.

If your Atari works all of the time, try re-doing the checks
and also try varying the temperature (slightly longer freezing,
a bit more heating). Please note that your Atari will warm up

quite fast if you take it out of the fridge, also it'll cool down quite fast after switching off the hair-dryer.
If you still have no success, it could still be the power-supply (also check it for thermal problems) or completely another problem.

If you had 'success' (eg. the Atari only works when it's cold) you'll have to get some cooling (freezing) spray from your local electronics store (eg. in Germany look for "Kï¿½lte Spray" made by "Kontakt Chemie" at Conrad electronics or so).

Now you can use your hair-dryer to warm up all ICs of your Atari and the cooling spray to cool down a single IC.

If your Atari only works when it's cold, power up your opened Atari and warm it up until it stops to work. Now power it down, still heat it with your hair-dryer and then quickly use the cooling spray to cool the first IC (1-3 seconds of usage will be enough to get an IC below 0ï¿½C). Now quickly power it on (within a second or two at maximum!) and observe if it works or not. If your Atari doesn't work, power it down, heat it up, and cool down the next IC and again power it up. Repeat this procedure until you've found the broken IC(s).

When you think you have discovered the broken IC(s), check if you are able to reproduce the effect. It still could be that you have been a little bit too slow / too fast or that you slightly cooled down the IC next to the one you were checking and the one you think that is broken, actually works.

Anyway, if you are able to reproduce the good/bad effect several times, there are good chances that you have found the bad IC. Now just replace it and hope that fixed your Atari.

BTW: Finding a thermal problem is an extremely nasty task. Among the worst things you can come across in the world of computers/ electronics, IMO. You'll need a lot of time, patience, and strong nerves to find them. Good luck anyway!

HTH & so long,

Hias

An even more basic question is where is this emulator located? I haven't been reading the 8bit Atari newsgroup for the last couple of years and am not up to date on any of the emulators. Is this a good one? Which one does the group consider the best emulator available right now?

I still have my modified 800XL at home but haven't fired it up for several years. All I have left as far as software is concerned is are a few of my favorite cartridges. Would be nice to get an emulator and some images to play around with since I'm not sure my Atari even works anymore.

Hello,

I've just bought LDW 2000 SYUPER disk drive for ATARI computer but I
haven't any manual for this.
I'm looking for electronic version of the LDW 2000 SUPER USER'S MANUAL.
If anybody knows where may I get this, please give me a link to WWW
page.
Thank You in advance.

Duh!

I must have had my brain in neutral when i typed that message it was complete bollocks!

What I was after was instructions for my Atari Computer Chess Cartridge. The problem I have is that if I check computers king, he should not be able to castle for the remainder of the game ... but he still allows himself! However, if he checks me, I CANNOT castle after that point!

Hope someone somewhere can help!

Neil

I think there is an even smaller solution, something like a SIMM PC. Made
somewhere in Eastern Europe IIRC.

We may be running into a time crunch if we haven't already hit it. There is
a big of a gap between Atari and Commadore selling billions of dollars worth
of 6502 based merchandise and now. The time for this to happen would have
been around 10 years ago when there were still a lot of 6502 programmers
around.

I'm getting real rusty with 6502 programing in any format and let's face it,
some of the best 6502 programmers have already died.

As mentioned in my other post, there's the DIMM-PC built by Jumptec from germany (try www.jumptec.de or www.jumptec.com). But IMHO it's too slow for an emulator - only pentium-class speed. Actually, I've never really tried it, since the evaluation board (with standard connectors) is quite expensive - a friend of mine is working on a project (at work) with such a DIMM-PC, but speed does not matter too much in their case.

> I'm getting real rusty with 6502 programing in any format and let's face it,

ACK.

I did a little bit of 6502 assembler programming some 2 weeks ago and realized that I've forgotten a lot of the stuff I knew some 10 or 15 years ago. Like small assembler 'tricks', eg optimizing for space, some of the Atari-specific memory addresses, display list codes, hex to mnemonic mapping and all that stuff.

Oh well, it's been a long time since I knew every litte bit of my Atari and was able to write small assembler programs in hex (or even ATASCII) without using an assembler...

Good old days...

so long,

Better solution for a thermal problem.

Go to Radio Shack or similar place and buy a can of
"freeze spray". This stuff comes in an aerosol can
with a small tube so that you can spray individual
components.

Open your case to expose LSI chips and MB. Fire it up
and wait for symptoms to occur. One by one, spray the
various chips with the freeze spray, which will instantly
lower their individual temp. Once you spray one and the
computer starts working again, you know which chip to replace.

ttfn ...
```

Sorry, I don't know if there existed an english version of the printed manual at all. But you might try machine translation - that should at least give you a clue, but there are huge quality differences between the different (online) translation programs. I you need only a short paragraph, I could do it.

> that point!

I doubt there's a software bug, as castling is one of the most peculiarly restricted moves in a chess game. You'd think that logic would be among the most heavily tested. You probably just misinterpret the conditions under which you can castle: both pieces can't have been moved before, there must be no pieces between them, and none of the king's three squares (start/skip/end) can be in threat. I suspect that you escaped check by moving your king or rook, where the computer escaped check by blocking or capturing your threat with another piece. That would forfeit your ability to castle for the rest of the game while the computer's option to castle later is still viable, "according to Hoyle".

At the moment Atari800 and the various ported platforms offers the
most complete emulator available. The windows version, Atari800win
Plus evolved from Rich's Atari800win and as the Plus suggests has had
many improvements added and for a Windows user it is the best emu
there is.

Basically it handles pretty much anything you throw at it, supports
most if not all the carts there were (is) and the main core is
constantly being worked on as well as additions by the platform
specific people.

I think you will like it kit :-)

Seems like a lot of manufacturers are doing it now. I did a quick search to see if I had a memory fault and even a group in Canada has come out with a SIMM PC. There seems to be more focus on using a Linux OS which is probably a good idea.

I suppose I should read up more on the other formats like PC104 but I am getting lazy in my old age.<grin>

the Sacramento

I understand that her Atari clone will use a lot of the same hardware as the
C=1 (graphics, sound, etc).

Will it be possible to write software that will work on both the C=1 and
16-bit Atari clone? If not, this should be looked into, as it would double
the market for any future 16-bit software.

I think the next board (C=2) should be compatible with the Atari and Apple
II GS. If this can be done, she'll sell a ton of them.

> Archon, BallBlazer, Joust

I know archon and joust, but what I'm really doing is comparing the atari
versions to the arcades anfd judging if the atari versions were better. I
prefer the atari version of zaxxon than the arcade, which I can play using
mame. That's how I'm "judging" Atari games. So when I asked if robotron is
good, I'm really asking is there any aspect of it that's better than the
arcade or mame version?

Atari pengo, donkey kong, millipede with the atari trackball, and zaxxon in
my opinion kick the shit out of the mame versions.

And I also got a brand new C64 from ebay. I am awed by Alien Syndrome. The
scrolling is so smooth, the weapons are so perfect and the coop play so
addictive, nice background graphics and end bosses for each level. Real
classic arcade shooter type stuff. The smooth scrolling in clear graphics
in Atari zaxxon is superb, and I like the frenzy of all those bugs running
around in millipede. With the trackball, atari millipede is a blast to play.
```

Getting in check doesn't prevent you from castleing later.
If you block the check, or take the checking peice, you can castle later.
You can't castle out of check, or castle if either peice has moved,
or castle if the king passes thru or ends up in check
Note that you have to move the king first, computer chess you
only move the king over 2 squares, the rook automatically moves
around. In real chess you should move the king first.
```

New Lynx Daemon's Gate $49.95

Tons of new items ready or soon to be ready to ship.
Ready now!! Lynx Daemon's Gate Test Cartridge. This appears to be a complete working Deamon's Gate for the Lynx. It is a Role Playing Game by Imagitec, the same people who did Viking's Child. No instructions yet. I will post instructions as you the role players E-mail them to me. Now shipping at $49.95 S&H. Call today. Coming soon. Demolition Man Video sequences for the Jaguar on Un-encrypted CDROM. My first batch of 30 had a bug from the duplicator and did not work. Hope to be shipping in a week for the initial price of $30. This is 20 minute of video sequences made for the game but do not include any of the actual game play. Also it requires one of our new CD Bypass cart, or Jagfree, or Protector SE, or Battlesphere Gold, or CD R, or a DEV System to run this un-encrypted CD ROM. Shipping next week our new CD Bypass cart at $39.95 allows you to run Un-encrypted programs on your Jaguar CD-ROM System. Also we plan to start shipping Charles Barkley Shut Up & Jam for the Jaguar in May. We have 5 more CD-ROMs in the works that will be IBM compatible with developer stuff from Atari Engineering. Hope to sell these at $14.95. First one is RAW digital and sounds souces for Demolition Man and another is Jaguar Artwork files in EPS, TIF & Gif format and another Leonard Tramiels TT hard drive backup, and anotherST & TT Atari Archives and another??? Watch for details.

I have to agree, his views on auctions is a bit odd. I get lots of cool
stuff from ebay, and for what I feel is the right price.

> pps for a refreshing change, try www.myatari.com - they've been around for
> years and they're nice people.

I ordered some mouse extensions from one of these other so called
'reputable/nice' dealers, and I got joystick "Y" spitters with one
of the ends cut off, thus making it appear to be a mouse extension.
It had bare wire exposed and all. Really made me wonder!

However I then ordered the same item from Ben and was rather happy
to get a real mouse extender cable. Longer and for less even...
go figure. Ben came thru for me.

2512. Atari 800 BASIC & Video touch pad?

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-26 04:39:44 UTC
From: av1d@aol.comp.com
Message-ID: <20020426003944.26382.00003725@mb-ff.aol.com>
Source record: 29783

Hi,
I am having problems attempting to program the Video Touch Pad via Basic on an Atari 800.

This is what I've got so far:
By pressing two buttons in the same row, but the right hand side of the pad this will return "1".

```
10 ? STICK(0)
```

But the other buttons do not return any value, and you must press atleast two to make a change.

I've also tried STRIG, PTRIG, PADDLE, etc. and nothing seems to work.

Any help is appreciated very much.
Thanks

Castling is for sissies! I always gambit a few pawns in the opening,
then sacrifice a piece for the quick mate. :-)

Seriously, the Atari Chess cart was good for 1980, but I tried using
it to teach a nephew and it just doesn't have enough options for that.
Okay for a quick game, but really limited. As mentioned, CM 2000 is
probably the most advanced program. Parker Bros Chess is also pretty
flexible if you prefer the cartridge format. Its difficult to find ,
however, and the fairly thick manual is even harder to come by.

I've got a copy of Lancelot on 5 1/4" disk, though don't think I have the capability to make a disk image unfortunately. Can it be done easily with a standard Atari 130XE plus disk drive? I managed to transfer a lot of my tape tape games onto disk about ten or so years ago (including another text adventure called The Golden Baton), so it may be a good idea to try and get up to speed with doing this before it's too late.

Really mature!

Love my Atari's no matter what Jim Brohier says. I haven't gotten the mail,
but perhaps I'll get it now! Because I scream ATARI RULES to Jim.

Yes, a fairly sound port of the arcade..Well worth a play.

As arcade conversions go I have to say that Defender is one of my
Atari fave's.

If there's any originating IP's in the email (not completely anonymous), be sure to forward all of it to the source ISP.
Threats and harassment will get him removed quickly and then we won't have to worry about it any longer :)

Let me know if you require my help in tracking him down. I'm sure someone has an old atari that can be used as a
"manually operated variable speed impact device" :P

Cheers Donald, I'm well versed in the old dropping the plonker in the
pooh with the ISP trick :-)

He forged the headers but only as much as he could understand how to.

He seems to be a well known troll who visits many groups including
here a short while back, I was not the only person to get the garbage
:-)

The Lancelot disk you have may be protected with bad sectors. First you should make a sector copy and note all the bad ones. You can use any of a good number of sector copiers out there. Diskey was one I used extensively many years ago. There are lots of good ones these days. You could then use the DiskCommunicator by Bob Puff of CSS to convert the sector copy of your original into a large DCM file which then could be uploaded to a BBS or copied to a unix box or IBM-PC over a null modem cable using communications software such as BobTerm. This last bit is the tricky part, since you would need some kind of 850 interface or PR-connection or Atari modem to get a standard serial port. You can find all these software utilities at the CSS website here: http://www.nleaudio.com/css/Files.htm

If your drive has an upgrade that lets it read double density disks, and you have a PC with a 5.25" drive in it, there's an PC MSDOS app called "ANADISK" IIRC, that will read Atari DD/DS disks (i.e. the 360k ones). I've done this myself with success.

Or... you could always break down and spend the 15 bucks or so, to buy an SIO2PC cable, and transfer files with ease using software such as SIO2PC, APE98, or Atari810.

You may find that there's a lot of interesting stuff on the internet for Atari's these days once you've got a nice connection for the data to go through. Of particular interest is the excellent Space Harrier port/demo just released a few weeks ago by Sheddy.

>Thanks

A couple of day ago, I posted this information in reply to a similar
question already. The video controller is just simply a keyboard
controller. You have to program the joystick ports (actually driven
by a PIA) as outputs, and then scan the key matrix yourself, and you
even need the paddle port for this too. This is documented in the
Atari technical reference notes.
I wrote an assembly language driver that you can poke from basic and
the use to easily get the key pressed from basic. Look in the
binaries newsgroup or look on the Pooldisk for this information.
In the stack directory you can find an ATR that contains the driver.
If you can't find it, E-mail me.

Keep thiose XL's/XE's humming.

2530. Fun with atari two player simultaneous

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-27 10:16:26 UTC
From: twh1@gmx.de
Message-ID: <3cca74d0.693797@news.tgz-ilmenau.de>
Source record: 29601

Howdy *.*!

I'm now holding thousands of atari games an my ape configured
notebook, ready to have fun with it!!

So the most fun will give those games where two player can play at the
same time.I think it's a lot more fun against network based games,
where everbody is just sitting in it's own room.

So my question to all Atarians is: What is your favourite two player
game? I want to build a list, which (hopefully) much unkown two-player
games and great concepts !!!

Here is my list of games I still remember, please complete it!!!

--- cut ---

* Atzec Challenge II
* Ballblazer
* BMX Simulator
* Bruce Lee
* Fantastic Soccer
* Gunshot (Epyx)
* Grand Prix Simulator
* Gauntlet
* International Karate
* Joust
* Kick Off
* Kickstart
* Mig Alley Ace
* MULE
* Megablast
* On-Track
* One on One
* Paver
* Pro Mountain Bike Simulator
* Pong (which pong might be the best?)
* Pitstop II
* Rampage
* Rebound
* Schreckenstein
* Seawolf II
* Spy vs Spy I, II, III
* Tank vs Tank
* The Goonies
* Twomaze (Pacman clone)

* Tennis
* Trailblazer
* Unicum (Tetris Clone)
* Wizard of Wor
* Zybex

--- cut ---

Well I'm sure, I've forgotten a lot!!! but please help me to complete
my list!

and always remember: All you need is fun!!

Of that list my favourites are:
Wizard of Wor, Grand Prix Simulator, One on One, Kickstart. Another
of my favourites not on the list is Mario Bros. (the XE version).

Another 2 player game I can think of is Diamond Mine.

Try B&C ComputerVisions. They probably still have upgrades. Or if you
just want schematics, http://4.33.97.43 (online most of the time). Look
in downlods section, Or ftp://4.33.97.43 (download memory.zip).
I think these are the best, but I'm biased.:-)

Yes, but buggy.

Find A5 14 C5 14 F0 FC and replace it with A9 00 8D 08 D2 00.

The XE version is very different.

And regarding your list, add Cuttlemania and Capture the Flag.

There was some funny game with two springs jumping on the checkerboard
but I can't remember the name.

Source record: 29614

The 5200 conversion of Mario Brothers, Gremlins, and Moon Patrol do not set the Pokey chip correctly after a file load (although they do not seem to have a problem on the 400/800 OS). Only takes a little bit of added code to fix it.

The 5200 conversion of Mario Brothers is kind of fun in two player battle mode
(where you try to get the other guy killed) because of its weird physics. You can get someone bouncing straight up and down on top of you, and time it so they land on an enemy, or just time running under them and bouncing
them way up in the air. Most irritating feature is that is seems to use latched
trigger mode and doesn't always clear it when you die, causing you to jump at the start of a level which can cost you some time. There are other weird quirks in the game also. I really always wanted the XE version but never have
seen it in person.

No, it was programmed for the Atari computer. Its a 16k version that was not released. Don't have it, but supposed to be pretty bad. The XE version is great. A wonderful job by an unknown programmer. I believe Sculptured Software did this conversion, so anybody know who worked on XE Mario?

>> The video controller is just simply a keyboard controller.

The early catalogs pictured keyboard controllers and also listed them
in the accessories section. Did any Atari program for computers use
them? Or was it some unreleased program.

what is the (very) original PONG Version on 8-bit? I've only found
several clones and crappy public domain versions. Is there an version
availble by atari itself?

(If so, could somebody send me a copy?)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

In my opinion, Xformer has been one of the worst 8-bit emulators for a long time now. A number of better emulators have been out that were more compatible and much better than Xformer like Atari800 DOS, Atari800Win (not plus), Rainbow or even Xl-It which has been around since probably '97. I agree that Atari800Win Plus 3.0 is the best and it's almost taken the place of my real 130XE!

Hello,

Simply press the START button. Note from the manual:

The computer which follows your orders for the German armies but
controls the Russian armies itself, needs a certain amount of time to
decide its strategy, and if you ask it to execute your orders before
that time is up, it shows the message SORRY, I AM NOT READY YET! in
the yellow strip. If this happens, wait until the message becomes GO
AHEAD, I AM READY NOW! and press START again.

Have fun,
eric

Hi Nolan,

I was missing the Albert E. Spreadsheet disk. Well, not missing exactly, rather my original went bad. I did get another copy in disk image format emailed to me, that appears to work, although the source did note that several sectors on the original were invalid (18 or so, starting from about sector 13). So... I'm not sure if this is a complete copy or not. If you could produce an image from your disk in order to verify the data that I have, it would be a big help.

Thanks!

We are referring to the CX50. Its listed in the 1980 and 1981 Product
Catalogs, but doesn't seem to be associated with any program. Maybe it
was for some forgotten financial program and the CX85 was a successor.

2. Ultima IV Quest of the Avatar Player Reference Card
3. The History of Britannia, as told by Kyle the Youger book
4. The Book of Mystic Wisdom, as told by Philpop the Weary book
5. The Ancient Liturgy of Truth book
6. The Book of Amber runes book
7. 2 disks (sides A, B, C, D)
8. a leaflet advertising the The Way of the Avatar Clue Book
9. a metal Ankh

According to the box, I should have:

1. 2 Game disks
2. Cloth map
3. History of Britannia
4. Reference Card
5. Metal Ankh
6. Book of Magic

It's obvious I'm missing the map. My confusion is with the other booklets I have that aren't listed on the box. Are they from another Ultima?

Any help would be appreciated. Also, anyone know where I can get the cloth map? ;-)

-Bob

I MAY be wrong, but I believe the "Liturgy of Truth" and "Book of Amber Runes" are from Ultima III. The first is for Clerics and the second for Mages.

The map...you're on your own for that one. I hate to say it, but I'd suggest EBay...they're not easy to find.

==========

As far as I remember, Atari never released an 8-bit version of PONG. Home
computers came long after the game machines, by that time people were
looking for fancier games.
There was a faithful 3rd-party release years later (still in the 80's), but
it escapes my memory who made it.

In BASIC, type:

?USR(58487)

Guess what does that do? This is same as hex $E477. It does the power switch button, like as if you press the power switch on/off.

If you turn off the disk drive (no DOS load in), and typing ?USR(58487), it will reboot and then load in the usual Atari diagnostic.

Mike

You have everything you should have except the map. Cannot figure out
why you do not have it. I can scan mine and email it to you if you
want. I think the only way to get it is to buy another copy of Ultima
IV and it does not have to be an Atari version.

THe Keyboard controllers were originally designed for use on the Atari
2600 Video Computer System (aka game console). They allowed you to play
games such as Hangman, and also to program in BASIC (with the proper
cartridge). The Video Touch Pad was internally the same as a keyboard
controller, the casing having been redesigned to be marketed with
the "Star Raiders" 2600 version.

Look for my "Atari Controller Notes", my very first post on this NG
(and barely on *any* other NG), from some 7 years ago under the
name "JTKirk"... Or check the link on my page, at
http://www.geocities.com/Hollywood/2645/atari.html

$E477 is the Jump Pwrup vector. $E474 is Jump Reset. The jump vector
tabel starts at $E450. Try $E471 (58481).

the 65832 was scrubbed (don't ask me why, questioning WDC's wisdom is not my
dept.)
but if they did go through the design phase, I wish they'd release the VHDL
for it, then it
could be used to set up a FPGA to act as a 65832, anyone from WDC listening?

2574. Atariada 2002: New 16-player racing game release for 8-bit Atari...

Newsgroup: comp.sys.atari.8bit
Date: 2002-04-30 12:13:17 UTC
From: TXG <txg@the-underground.myweb.nl>
Message-ID: <3cce8a9e$0$37924$e4fe514c@dreader3.news.xs4all.nl>
Source record: 29646

Hi,

We the MNX crew (Fox-1, TWW and TXG) and 2 persons of the Foundation Two crew (Mad Butscher and Mr.X/Y) are back from Atarada 2002. This event was even better then last year and we saw the release of the new racing game written by BeweSoft.
This game supports the game-link interface so that you can use 8 computers with the game. Each computer can handle 2 players, the screen is horizontal split just like in pole position. The detail of the cars is good. You see your nummer on the doors and the back of the car.
The game is very good, but when you play with 16 players it is hard to drive because of the heavy traffic on the network I think. When you play with less players I did notice a improvement of the driving...

Overal this is a very good game and it's FREEWARE...

TXG/MNX

CX21 - Video Touch Pad (Star Raiders), CX23 Kids' controller (Sesame Street Games) and the CX50 Keyboard controllers (Basic etc) were all functionally the same (I think). And yes, they were all used on the 2600. So what is the CX50 doing in my 1981 Atari Personal Computer Product Catalog?

"Golden Oldies" sounds familiar, that's probably the one I was thinking of.
Thanks.

Well if memory serves, there was a BASIC programming cart made for the 2600,
and I believe it was used in conjunction with the CX50's.
If you notice, the keypads have like a dovetail that will attach them
together to form a small keyboard. This is just what I've put together after
gathering the evidence, I never had BASIC for the 2600 and I only have one
keypad controller.

I've never seen one up close but I wonder if it uses the same as the Radio
Shack CGP-215 plotter, the small printer plotter with mini-pens.
I believe Radio Shack may be your best bet here in the states, problem is
matching the pens up and they may have to be put on order, maybe someone can
send you a dead one to use for a match.

From: Dan Vernon <dan@retrobits.nospam.net>
Message-ID: <aapbfe$fs5$1@news.chatlink.com>
Source record: 29666

here's a blurb from Antic vol 5, no 11:

"A number of readers replied to Russ Novotny 's cry for Atari 1020 Plotter pens (December, 1986) Radio Shack carries a set of three black pens (26-1480) and another trio with red, green and blue (26-1481). Each of these 3020-compatible sets costs about $2.95. If you're out of paper for your 1020, Radio Shack's rollpaper for the CGP-115 plotter (26-1428) will do fine--but you 'II have to transfer some paper to an empty spool, because the full CGP roll is too big to fit into the 1020."

I don't think Radio Shack carries the pens anymore... but a search at their website comes up with a couple of product manuals based on the part numbers above.

It looks like these guys at least have some black ones (for $1.99 -- not bad!):

2596. can you identify this (Atari?) "Mystery Cable"

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-01 19:37:18 UTC
From: Dan Vernon <dan@retrobits.nospam.net>
Message-ID: <aapfv1$i18$1@news.chatlink.com>
Source record: 29667

I picked this up somewhere in my travels over the past few years... can't exactly remember where.

http://www.retrobits.net/images/mysterycable1.jpg

http://www.retrobits.net/images/mysterycable2.jpg

One end is a pass-through 13-pin Atari SIO connector, so you can easily hook it on your serial bus, and still keep your other devices attached. The other end is for plugging into a card edge connector with 9 wide contacts (the middle 3 connections are absent). The fact that it has a pass-through connector on the SIO side, and that its got a little base on it so it lines up nicely to the 800XL SIO port, it seems like it must be for the Atari, or at least another computer with a 13-pin interface like the Atari. Its got the General Electric logo on it, which makes me imagine hooking my Atari up to an "Appliance Control Center" or such device, to control my coffee maker, toaster, dish-washer, etc.

What do you think?

-Dan

This looks like a cable to the GE data cassette. It was switchable between
C64 and Atari. I may still have mine around somewhere. It was about $10
cheaper then an Atari brand cassette at the time, something like $70 vs $80.

Hi,

This cable is from General Electric, the SIO connector was made by AMP.
I have seen these in the past, I believe the are used with a General
Electric color matrix printer.

2600. Re: 128K upgrade for 800XE

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-01 21:52:09 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3cd068ac_5@nopics.sjc>
Source record: 29671

You can dump the internal Basic and just re-program the PAL itself to do ramdisk selection. I have a 1200XL with a 512K battery-backed SRAM that works just great. Once the files are on the "disk", you can shut off the system for as long as you like and they'll still be there on the next power-up. I send PB4, the ramdisk selection bit, into the MMU instead of BE (Basic Enable) and output the ramdisk chip-select on the BASIC chip-select line (this line has to be gated with CLK02 at the SRAM). You should be able to wire the 512K chip into the Basic ROM site (use a little board). Works great on my 1200XL - should be fine in the 130XE or 800XL. I can supply a programmed PAL if you need one.

Bob

.... I'd like to know where to get 512Kx8 SRAM for $7... I pay almost $20.

I have 2 of them. One belongs to my General Electric Cassetterecorder interface (to use ordinary audio-tapedrives on your XL/XE computer) while the second belongs to my General Electric printer interface. This interface came with two cables. One is to connect the centronics-like interface to your Atari, the other to connect the same interface to a VIC20 (C64?).

Right. I bought two of those cables on the street, really cheap, some years
ago... I wanted the connectors for something, but by now I've already
forgotten *what*...

Either Atari or Radio/Shack replacement pens work(overseas I do not know where). But, be aware that all of the pens are VERY old. Many(MOST) will be dried out and not work. Sometimes, soaking the tip in alcohol has helped.

I do not know about refilling. Seems a lot of work. Maybe someday I'll look into cleaning out a pen and filling with sometype of ink.

"Proper" Note and Point is to use Sectors and Bytes...locating the physical position on disk. What you are doing with Sparta is getting the current location with in a file..in byte offset format. Sparta does the conversion to sector/byte to control the drive.

The code to use byte only is not in MYDOS or any other DOS I am aware of, someone else will know. I have not tested it, but it shouldn't matter as long as indexes are not moved between DOSes.

On any Atari type dos (not SpartaDOS, but Dos 2.x, MyDos, etc), they all
use a file system with a directory entry that has a pointer to the first
sector of the file. Then, each sector of a file has a pointer to the
next sector of the file. Because the DOS structure chains each sector
of the file in this manner, there is no way to know which sector
contains the 1000th byte without reading all of the previous sectors of
the file first.

Hi

Tell me if I'm in the wrong group for asking this question...

How can I connect a scart connector (euroconector) to an Atari 2600? is there any web where it's showed? I heard some time ago it's not difficult to do it soldering some wires directly to the board...

Thanks, and excuse me if I'm in the wrong place...

Regards...

The purpose of "POINT" is to avoid that complete read for moving the file pointer. You have to create your own index by reading the file and "NOTE"ing the location of pertinent data the 1st time only. After that you can "POINT" to what you want to read or write a change. Caveat is *do not* create your index with Sparta and attempt to utilize it with Dos 2.0/2.5/MyDos.

You also need to preserve the index with hard code in your program lines or place them in an array and adjust the SAVE pointers to include the String/Array tables in your .BAS file.

: The Hearse's first great trip????

No. Besides the fact it consumes lot's of expensive fuel, the Hearse only has one seat to fit up to 3 persons, but we went with 5 people to ATARIADA. The idea was to rent a car for the trip as we all drive 2 or 3 seat cars while the 2 Germans didn't had a car at all.

Renting one turned out to be very expensive so we just bought the first cheap used car we got in sight, which was an old '87 Citroen BX16. We already had an oil-leak before we left our hometown, and at our arrival in Germany we got a water-leak so the engine got overheated. At our trip back we even "lost" the car! TXG forgot to place it in "P"ark (it has an automatic gearbox) and the BX decided to make a little trip on his own when we were out to eat something :-))

: And WHOM did you loose? (curious, as always)

Mr. X/Y (Rouven). Long story of which no one knows the exact details, including Rouven since he was too drunk :-)

: And where can I get that game Rene is talking about. I still don't know.

It's on a harddisk located 1 meter away from where I sit right now :-) Problem is I didn't had the time yet to unpack all my Atari-stuff again so I can't transfer it to another media (A.P.E.-ATR, BBS, ect.) right now. Will place it on my site as soon as possible, ofcourse, NOT in ATR but just as an LHARCed Atari-file. The original disk started up with BeWe-Dos but it runs o.k. with Sparta-Dos 3.3b too, since this is what I use on my harddisk-systems. Another DOS maybe also works, but I didn't tested that. The game is a single file and starts up with a quick text with a very short explanation and a line that he didn't had the time to finish the doc's. It'll probably be on the next ABBUC magazin too...

[snip]

I was refering to the pad from a 2600 console.
It's a black sloped plastic case which can use a layover [looks like an
intellivision controller only nicer, natrually].
The pad has 12 buttons and across it's top is printed "Video touch pad".
They are quite common in the U.S. at swap meets and flea markets.
Thanks to everyone who replied, especially Ernest.

The XE mario bros was excellent. Unfortunately there isn't any known copy
circurlating the internet. Though, check out Jindroush's page for a title
screen shot. I'd love to get my hands on the rom some day. There is a good
XE crystal castles version too that plays much better than the 5200 version.
Well worth a play.

Davide,

From my experience, the biggest problem with the 1020 plotter is that one of the plastic gears always cracks causing the plotter to jam up. I had an old one and a new one out-of-the-box that did the same thing. The same gear broke. I gave up on these things because they print really really slow and the pens always dry out.
I got pens from Radio Shack. These are numbers from the 1997 catalog - (RSU 10274850 - black) and (RSU 10274868 - color). I would guess that most of these old stock items are dried up now anyway. If you find pens, you will probably have to rejuvinate them. The volatile part of the ink has evaporated. WD-40 or some type of alcohol might wet the ink if you can inject it inside of the pens. Good luck.

Ralph

I think it is, certainly 'Tandy' (the UK Radio Shack name) sold the
pens for one of their plotters all those years ago. One of the Tandy
plotters *definitely* used the exact same pens.

Tandy or Radio shack has been mentioned but you could always try Bravo
Sierra or Best Electronics, Ben advertises in here every week and Best
do have a website which I can't remember the addy.

Best may be your (no pun intended) best bet..

Hi Mathy!

On Thu, 2 May 2002 13:06:24 +0200, Mathy van Nisselroy wrote:
>
> With my design you do not need a switch.

I know. But IIRC you mentioned some time ago that you had timing
problems with 800XL and 800XE machines. Another problem would
be getting the CO25953. So my first idea was to merge both designs
(Newell's and your's) since the Newell-design is known to work
with the 800XL. (I still have to find some time to do this, so
at the moment it's only just an idea).

While studying your schematics I stumbled across something strange:
If I got it right, the LS158 is clocked directly by PHI2.

I checked with my 800XL schematics and there the 158 used for
built-in RAM is clocked from a tapped delay-line (driven by PHI2):
PHI2 is sent through a schmitt-trigger (U19/LS14) and then goes
into the delay line (U29). Pin 10 of the delay line is then connected
to pin 1 of the LS158.

Maybe that could be causing the timing problems?

I've managed to loose my copy of the 130XE schematics, so I couldn't
do a double-check what Atari changed when introducing the Freddy
chip...

BTW: If someone could point me to a copy of the 130XE schematics,
I'd be very glad. IIRC I downloaded it some months ago from
somewhere but I didn't bookmark the site :-(

so long,

Hias

Anyone have a working copy of this game? I just purchased an Atari lot and the box and manual were included, but unfortunately, with no disk. Its a very interesting sci-fi RPG game with a number of races, weapons, goals, and so on. Its supposedly the sequel to Galactic Gladiators, but in reality is a very different, more in-depth game.

Anyhow, if someone would supply an ATR, DCM, or even mail me a copy, I'd be happy to scan in the box, manual, and Atari reference card, and post it on my website!

The reference card is quite amusing, here's a quote:

"Since the advent of Apple Galactic Adventures, there has been a major reform of the monetary sytem. The new frilbee, Atari Frilbee, is worth 100 of the old frilbeees. Thus everything costs 1/100 of any prices listed in the rulebook. Also, in the Atari version, if you should reach 65000+ frilbees, you will lose all but from 0 to 255 of your fortune."

I love it! This is classic stuff. The bugs are actually presented as cool new improved features of the Atari version!

-Dan

Well,
- Clash of the kings (Archon clone from BBK/Analog mag.)
- Pong (not released for 800/XL/XE by Atari, but various versions from
Analog, Antic and many other sources)
- Blip (a Pong clone by HARD software hungary)
- Video classics (Silverbird, thats where HARD software had stolen the
title picture for Blip!)
- BMX Simulator (Codemasters)
- Grand Prix Championships or so (Codemasters)
- Zybex (Zeppelin)
- Bruce Lee (Datasoft)
- Leaderboard / Leaderboard Tournement (1-4 Players; in Europe: US Gold)
- Gauntlet / Gauntlet Deeper Dungeons (US Gold)
- Dandy (APX and nowadays PD! 1-4 players on 800, 1-2 players on XL/XE)
- Aliens (Dandy clone, PD; 1-2 players only)
- Super Breakout (1-8 players on 800; 1-4 players on XL/XE using
Paddles)
- pre-version of Megablast 1 (by torsten Karwoth, released in Happy
Computer;
no digisounds, no computer opponent, 2 players only, forgot its
name...)
- Basketball by Atari
- Hockey by thorn EMI
- One on one by Atari/EA? (one human against computer or human vs.
human, if I remember correctly)
- T-34 by Mirage/ANG (2 players only, no computer opponent; requires
128k machine);
- early PD versions of T34, like "ritter und Schloss" (Knight and
Castle) and similar PD games written in Basic
- Naval Battle by Antic (PD)
- Battle ships by Mirage (now Freeware);

and many many more... greetings, Andreas.

That reminds me of something for my Atari 800XL.

Where can I find a composite video cable that goes in the back of the Atari 800XL? Who sells it?

Will I get a better video this way? (instead of using RF video plugs)

Mike

Those cables are not so common these days. I found one last weekend in a bin at a computer show/sale for U$ 2.50.

They are simple to build from a DIN-5 and RCA pin patch cords using the pinout schematic on Thunderdome.

Composite display beats the RF signal on mine; even the washed out XL - the 800 is bright and brilliant.

==========
You'll get sharper video. With composite cable you get separate luminance
and chroma (hue) signals, eliminating artifacting (color bleeding).
The 800's had the best video of all, the 2-ton aluminum casting and tight
shielding helped too. There were some hardware tweaks (replacing a few
components) that could be done with the 1200XL at least, to generate
stronger colors.

From: ZaXXoN <zaxxon@mindspring.com>
Message-ID: <pvu7du4g1ih07apugginfemqbencmt6ab3@4ax.com>
Source record: 29565

Hey!

After years of doing without my Atari (gave it to goodwill) I
recently purchased a 65XE system on Ebay. Now - I'm not giving up the
Amiga or PC just miss the simplicity of the old Atari.
I'm looking for a source for games on floppy or instructions to turn
a file into a disk image. Just miss those old games and the user
groups and BBS's.

Help!

Depends on the file... A binary .EXE file can be placed on a disk or disk image with a loader or, sometimes, re-named to AUTORUN.SYS on a disk containing DOS.SYS. A compacted .DCM needs the re-creator application DisComm 3.2 for writing it out to a disk. Arcs and Zips and Lhas also require the appropriate app.

Aaron's site has lots of games.

2657. 1050 Modification

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-05 13:57:36 UTC
From: tony rudzki <tony.rudzki@nu-metrics.com>
Message-ID: <kTaB8.8065$Dx3.6383@nwrddc02.gnilink.net>
Source record: 29578

Does anyone have any information on this mod board for a 1050 disk drive? It appears to be home made, but is done on an etched board. The board is a satellite board that contains 4 logic chips ('139, '133, '277, '74) , a static ram, a 6502A, and an eprom labeled 'Super controller 7.0'

On the 1050 board, U9 and U10 have been removed, and this board is plugged into it.

Any help?

Thanks,

Tony

2658. breaking up compilations

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-05 15:17:45 UTC
From: tony rudzki <tony.rudzki@nu-metrics.com>
Message-ID: <t2cB8.8366$Dx3.1805@nwrddc02.gnilink.net>

Wow, that's a very interesting idea!

But for now i think I'll go with a standard DRAM upgrade - I have to
get rid of all those old 1Meg SIMMs and SIPPs taking away a lot
of space on my shelves :-)

> .... I'd like to know where to get 512Kx8 SRAM for $7... I pay almost $20.

It should be possible to find a store, but it could be quite difficult.
In my case it was more or less pure coincidence when I first heard of
"Segor electronics" in Germany. Most other stores here in Austria or
Germany want to have $20 or even $30 for a single 512K SRAM...

My only idea is: keep on searching...

so long,

Hias

2661. Does new 15kHz Monitors exist?

Hey!

Try Amiga related items on Ebay. All Amiga specific monitors can sync to 15k. A 1084s D1 is a good choice. I know of no new 15" monitors that can sync to 15k except good professional monitors like the Sony line. Willing to spend up to $500. for a new one? Also a Toshiba TIMM is a 20" monitor/TV no longer produced.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

errr, no. Composite carries Y and C signals on the same cable - it
is like RF minus the RF carrier. It is still quite a bit better than
RF though.

S-video carries them on seperate cables. AFAIK the XLs and 800
could only do composite as standard, the XEs were capable of s-video.

Howdy Matthias

> I know. But IIRC you mentioned some time ago that you had timing
> problems with 800XL and 800XE machines.

The 1MB 800XE has been checked. The weak Phi2 signal is causing the problems here. (now all I have to do is undo the damage the mail did by shaking it to much.)

The 1MB 800XL has a different problem. It works without the BlackBox, but with the blackbox, it stops booting somewhere between when the access LED on the BB is ON for the second time and when it goes OFF for the second time. Bob Puff tell me that is when some SIO stuff is handled/loaded.....

> Another problem would be getting the CO25953.

There is a file on my site called co25953-something that describes how to replace the co25953. I haven't really looked at it yet, but it looks promising. Although I should say that I don't know that much about GALs and PALs etc.
And Best Electronics and B&C Computervision are still selling them for $10 and $12.50 respectively. (NOT cheap, I know)

============

The 800's had these signals plus ground available at the 5-pin DIN
connector:

Composite video
Composite luma
Composite chroma
Audio

I still have the patch cable I made many many moons ago, routing Y and C
from 5-pin DIN to a mini DIN S-video connector so that I could plug the
8-bit to a TV.

Come to think of it, the Commodore 1702 monitor had a RCA jacket for
composite video in the front, and RCA jackets for separate Y and C in the
back. Mine is in storage along with the other Atari equipment, so I'm going

by memory.

The team at atariarchives.org is proud to announce that two more classic Atari books are now available at http://www.atariarchives.org -- bringing the number of books at the site to seven.

The two books are:

Atari Basic - A Self-Teaching Guide, by Bob Albrecht, LeRoy Finkel, and Jerald R. Brow, published 1979. This 330-plus page book is an introduction to Atari BASIC.
http://www.atariarchives.org/basic/

...and...

Computer Animation Primer, by David Fox and Mitchell Waite, published 1979. This 500-plus page book is a great general introduction to computer animation, and includes downloadable BASIC and machine language programs for doing animation on Atari 8-bit computers.
http://www.atariarchives.org/cap/

Highlights include a section on The Making of TRON (http://www.atariarchives.org/cap/showpage.php?page=125) and a 16-page section featuring color animation stills. (http://www.atariarchives.org/cap/thumbs.php?page=color1)

Thanks to the authors for allowing us to share their work.

Sounds like a dumb thing to auction, but maybe someone wants a brown
vinyl Atari-branded dust cover for their 800 machine.

See it here:

2686. Atari 400 A/V ?

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-06 20:58:56 UTC
From: danlucio@gmx.de
Message-ID: <ab6qqg$h1n$1@news.netmar.com>
Source record: 29507

Ok, I know this is possible.
But I can't find anywhere how to hack the Atari 400 and
extract composite video and audio. Could anybody help me?
BTW, Does anybody have any type of memory upgrade for a
16k Atari400 for sale or trade?

Daniel

Mo wrote:

> Well, this is what my translator spit out of this message.
> Maybe somebody can do a better translation...

Oh my god. Even someone without any knowledge of french will understand
a lot more from the original text ...

The original text contains a few errors, but after correcting these
clear bugs, <http://www.systranbox.com/> spit out a mostly
understandable translation (it doesn't know some words, one of them
still critical for full understanding).

Improved original text:
"Svp aidez-moi ï¿½ transfï¿½rer mes programmes atari 800xl sur
mon pc. je possï¿½der le cï¿½ble, mais je ne sais pas utiliser
de programmes, de plus, lorsque je connï¿½cte mon cable (port
imprimante sur le cable(i/o) du lecteur 1050) le lecteur ne
demarre pas. je ne sais plus quoi faire. merci
1) faut il relier le 1050 sur 800xl?
2) faut il utiliser le port imprimante ou le port serie?"

Machine translation:
"Please help me to transfer my programs atari 800xl on my
PC. I to have the cable, but I cannot use programs,
moreover, when I connï¿½cte my cable (port printer on
cable(i/o) of the reader 1050) the reader demarre not.
I cannot any more what make. thank you
1) is necessary it to connect the 1050 on 800xl?
2) is necessary it to use the port printer or the port series?"

What does the french word "demarre" mean?

Source record: 29519

Replying to myself:

> What does the french word "demarre" mean?

Hm - "de-marre" becomes "of-enough", but that does not make too much
sense ...

Answer:
The Atari 800XL connects to peripheral devices with the SIO (serial
input/output) bus.
There are two types of SIO2PC cables, but only one is common.
With the seldom cable you can control an Atari 1050 Disk Drive directly
from the PC.
The normal cable turns your PC into an additional Atari 1050 Disk Drive
(some programs can even emulate an Atari 850 Box with printer and modem
attached). The PC program allows to select the drive number (usually #2)
of the emulated 1050 and which virtual floppy disk is in it (or the type
of a new floppy disk). You must boot the Atari 800XL from your real 1050
(later, if you have all the things transfered to the PC, you can switch
the roles of the floppy drives and boot your Atari 800XL from your PC)
and copy all disks to the second drive. You must connect this cable to a
serial COM port on your PC.

Rï¿½ponse:
L'Atari 800XL se relie aux pï¿½riphï¿½riques au bus de SIO (entrï¿½e-sortie
sï¿½quentielle).
Il y a deux types de cï¿½bles de SIO2PC, mais seulement un est commun.
Avec rarement le cï¿½ble vous pouvez contrï¿½ler une unitï¿½ de disques 1050
d'Atari directement du PC.
Le cï¿½ble normal transforme votre PC en unitï¿½ de disques supplï¿½mentaire
d'Atari 1050 (quelques programmes peuvent mï¿½me ï¿½muler un cadre d'Atari
850 avec l'imprimante et le modem joint). Le programme de PC laisse
choisir le nombre d'entraï¿½nement (habituellement # 2) de ï¿½mulï¿½ 1050 et
qui la disquette virtuelle est dans lui (ou le type d'une nouvelle
disquette). Vous devez amorcer l'Atari 800XL de votre vrai 1050 (plus
tard, si vous avez toutes les choses transfï¿½rï¿½es au PC, vous pouvez
commuter les rï¿½les des lecteurs souples et amorcer votre Atari 800XL de
votre PC) et copier tous les disques au deuxiï¿½me lecteur. Vous devez
relier ce cï¿½ble ï¿½ un port sï¿½quentiel de COM sur votre PC.

Dear old friends,

it's been a loooong time since I last posted something, so a big "Hi!"
to all those who know me.

I recently installed the "atari800" emulator under Linux; it works
pretty fine.
Could anybody tell me how to use the .dem and other files? (well, I
know how to use the .atr and .com) Maybe there's already a How-To that
somebody could me point me at. It's somehow frustrating to have some
cool demos in such formats and not being able to see them...

Thanks in advance!

All the best regards,

Martin "Pimpf".

Hi,

if you are really so bored, than you might have interest helping me on
the design of an FPU-board for the atari 8-bit.

The FPU I like to use is the MC68881, because it is able to run on an
8-bit bus in asynchronous mode. It should run on a multiple of the
6502 frequency derived from the atari crystal.

The AS, DS and DSACK lines of the 881 must be somehow simulated in
hardware and/or software.

The hardware registers can be easily mapped into memory. My idear is
to map it into the further decoded address space of the GTIA or PIA
since this part is not used by anything and anyway reserved for the
hardware I/O.

I can provide all neccesary information as MC68881 datasheet, manuals
and application note.

Having the hardware done the software is needed. The application note
includes MC68K assembler routines to use the 881 as peripheral
processor for MC68010/8.
Which should be a good basis for developing the 6502 code.

Maybe than the math-rom routines can be replaced by routines accessing
the FPU directly to be compatible to all software using the standard
math-routines.

My time and knowledge on board-design is to little to bring it fast
enough forward. I have already a basic idear on the board-layout,
which I like to discuss wether it is feasible or not (timing).

Anybody likes to join?

If anybody has already tried to do this hack, I would appreciate to
hear of it.

Regards
Frank

If you use WinAMP, select "diskwriter" as output device.

When using any other player, search the net for a program named "total
recorder". With this thingy, you can record anything you can hear thru your
soundcard to a WAVe file (including RM, RAM and such, but this is off topic).

The best you can do if you want a new Atari monitor is to buy a s-video capable TV and wire up a cable for it. I have a 20" Panasonic that looks great. If you need a dual-purpose PC/Atari monitor, look for a JAM or some such. These devices convert NTSC video to VGA.

2719. beginning assembly programming help

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-08 06:46:12 UTC
From: Steve Chamberlin <slc@pacbell.net>
Message-ID: <UQ3C8.62$6E1.35122354@newssvr13.news.prodigy.com>
Source record: 29545

I'm using the cc65 assembler to try to get started writing some simple assembly language programs for the Atari 8-bits. The trouble is, I don't quite understand how to make my program into an executable file for the Atari, or exactly how the process works. Here's my entire program:

```
.code
lda #$FF
sta $02C8
loop: jmp loop
```

This is supposed to change the background color. Hey, I've got to start somewhere. :-)

This assembles okay with ca65, but when I try to link with ld65 I get the errors:

```
>cc65 -C atari.cfg -S $3000 -o test.exe test.o
Warning: atari.cfg(7): Segment 'EXEHDR' does not exist
Warning: atari.cfg(13): Segment 'AUTOSTRT' does not exist
```

and no output is generated.

Can anyone help me to understand what the atari.cfg file is all about, and what these two segments are that I'm apparently missing? How can I create a very simple test program with just one segment?

Secondly, what start address should I be specifying for my programs? Is there a standard Atari executable file format? Assuming I have the file on a disk, how can I load and run it using either Atari800Win or a real machine?

Thanks in advance for your help!

>
> Maybe that could be causing the timing problems?

I check. The LS14 is an inverter. It inverts the signal which is the same as moving it have a cycle. On cycle on a 1.78 MHz machine takes about 564 nanoseconds. Half a cycle is therefore 282 nanoseconds, add to that the approx. 10ms delay between a signal enters one of these chips and the time it leaves these chips and you get a delay of 292 nanoseconds. It then enters the delay chip which it leaves (according to my schematics) 260nanoseconds later. Add this up and the whole Phase2 clock is moved 552 nanoseconds back in time, of 12 nanoseconds forward. I can't believe that 12 nanoseconds are enough to cause this trouble. BTW it works in teh XEGS too. (but the XEGS doesn't seem to have week CPU's and buggy GTIA's) If if you think I'm wrong, please convince me.

> by Charlie Pride comes to mind).

I am talking about CD's that can not be played on CD's and MAC's. They have a small not on the front and back of the box. They do not have encryption as far as I know. They just auto load some code into a PC or MAC that will prevent them from being played on PC's and MAC's.

> Explain what your CDAP is please.

It's a utility that will let you play audio CD's on your Atari 8 bit computer.
At the moment you will need a BlackBox, but as soon as somebody writes an ASPI manager for different harddisk interfaces, it will work with other interfaces too. (one could say that ASPI is to harddisk interfaces what a Printer driver is to a printer)

CD Audio Player is written in TurboBASIC, so you will need that too.

Check out my site at http://www-users.rwth-aachen.de/mathy.van_nisselroy the CD stuff is on the homepage.

What's the resolution of the Genesis? Is it better than the Atari screen?
Maybe you could make the Genesis' video chip interface to the Atari?

CU Mathy van Nisselroy

PS or if you know you way around software and harddisk interfaces (other
then the BlackBox), you could write ASPI managers for these. Read all about
ASPI on my ASPI page at
http://www-users.rwth-aachen.de/mathy.van_nisselroy/aspi.htm

> errors:
[...]

The ca65/ld65 combo is probably the most flexible assembler around, but this comes with a lot of complexitiy that may get in the way if you're a beginner. The Atari config built into ld65 is more suited for large assembler and C programs.

>>cc65 -C atari.cfg -S $3000 -o test.exe test.o
> Warning: atari.cfg(7): Segment 'EXEHDR' does not exist
> Warning: atari.cfg(13): Segment 'AUTOSTRT' does not exist
>
> and no output is generated.

As you can see, these are *warnings*, not errors. So the linker should definitely generate an executable.

The memory layout specified in the builtin config file places two additional segments into memory, but your program does not contain these segments. You can ignore the warnings for a simple assembler program. If you really want to silence the linker add these two lines at the end of your code:

```
.segment "AUTOSTART"
.segment "EXEHDR"
```

This will generate two empty segments and the linker will stop to complain. Another way to fix the warnings would be to remove the references to the segments from the config file - but please make sure that you don't need them.

> Can anyone help me to understand what the atari.cfg file is all about, and
> what these two segments are that I'm apparently missing? How can I create a
> very simple test program with just one segment?

You may want to read the linker documentation which explains config files in quite some detail. In short: Config files are a way to specify output formats, place segments into memory, define symbols, file names, start addresses and some other things. As said above, ld65 is a very flexible linker. It can generate multiple files, relocate code suitable for banked systems, handle initializer functions that are called semi automatically if a module is referenced, supports the relocatable o65 format as output, and lots of other things.

> Secondly, what start address should I be specifying for my programs? Is
> there a standard Atari executable file format? Assuming I have the file on a
> disk, how can I load and run it using either Atari800Win or a real machine?

If your atari.cfg file is the same one that is built into ld65 (I'm not sure about this, because in this case you could also do without a config file and specify "-t atari" instead), you cannot specify a start address because the config file does not support this. Instead all programs are loaded to $2E00, which is the start address of the memory area specified in the config file.

Regards

Uz

Does anyone have a copy of Adventure International's Star Trek 3.5 that works? I have an original disk, but it will not boot. Scanned the disk and it looks like just a bunch of data (text and formatting) - no executable code!

Bob

```

I've never used CC65 before, but it looks like the linker needs to find those 2 segment names (and their locations in memory) to place YOUR code in the correct places in memory.

Someone suggested ATASM, which is a good idea. I would suggest getting a real atari and getting OSS's MAC/65 on disk or cart. The testing might go a bit slower, but OSS's assembler compiles right to disk ready to go.

This comes up so many times so I'm sorry to raise it again but I seem to be going in circles here! Is it possible to get ATR images onto disks so that they are bootable given;

a 1050 drive with US Doubler fitted
an Atari XE with 64K ram

I have no problems being able to read disks written on a PC using MyDos on the Atari, but I can't find a way of getting the contents of an ATR image transferred to a 'normal' disk using the Atari.

Any pointers would be much appreciated, many thanks!

Duncan

> 12 nanoseconds are enough to cause this trouble.

Well, it was more or less just an idea. And it's much easier to test
it on a real Atari than it is to calculate the timing delays :-)

Anyways, my basic thought was that due to the shifted timing it
could have been that the address lines are switched before the
minimum RAS/CAS hold time has elapsed. But even for quite slow DRAMs
this should not matter too much - I just checked with some current
datasheets and the hold time is approx. 20-30ns (some older RAMs
had hold times of some 80 ns which I had in mind). OK, even if the
timing would cause problems this should only affect ramdisk-accesses,
not normal use...

OTOH, I would recommend using the correct signal for LS158 switching
anyway, at least for 800XLs. It's just an additional wire from the
ramdisk to the computer and you are on the safe side considering
slight timing differences of various Ataris and ICs.

> If if you think I'm wrong, please convince me.

Well, I guess I can't :-)

IMHO it is more probable that the BlackBox itself is causing the
troubles - maybe due to an increased load at the processor signals,
maybe due to some (too) critical timings, whatever... I don't know

anything about the BlackBox design but without detailed specs and
a logic analyzer (or a scope) it will be hard to fix.

Sorry if I wasn't of too much help.

so long,

Hias

Or combine the best of both (PC and Atari) worlds :-)

For my latest Atari-development I used atasm and atari800 under Linux
plus a few small shell-scripts and a C-program to build an ATR image.

So I just had to edit the source files, type 'make' and run the
emulator with the newly built ATR image (atasm even supports building
a 'memory snapshot file' suitable for atari800, but I didn't test
this).

When the results started to get setisfactory I transferred the ATR
to a real floppy disk and tested it on my real Atari.

IMO it is extremely helpful if you've got a machine language monitor
(like a Turbo Freezer, Omnimon, Bibomon, ...) built into your testing-
machine, for debugging purposes. If your program crashes (or just
does not do what it should), invoke the monitor and examine the
memory, processor registers, stack, ...

Since my TurboFreezer was some 50 kilometers away when I did the
development, I had a closer look at atari800, which also has a
built in monitor program. And I can say, well, it works!

so long,

I've heard mention of a MS-Dos program called mule (not the game) that 'may'
be able to copy an ATR file to an atari fromated double density floppy on a
PC Floppy drive that 'may' be bootable of a US doubled 1050.

I have not had the equipment to try untill recently and i'm having fun
putting it all together between other projects so i can't say if it works or
not (or where to get it!) and proberbly won't be looking untill a back log
of other 'life stuff' gets sorted.

Anyone here care to coment on the program or any other methods not involving
the ritual slaughter of an SIO cable? ;0)

You could try using my WriteAtr program (available from my homepage
http://www.horus.com/~hias/atari/).

But note: it only works with double density (256 bytes per sector)
ATR images - most ATRs you find on the 'net are SD or ED.

you need to convert the ATR into a DCM on the PC side using a number of utilites out there. Steven Tucker wrote an excellent one (called Imagic, IIRC). Anyhow, copy the DCM to a DD disk on the PC, then on the Atari, boot to MyDOS or Sparta and run DiskCommunicator to convert the DCM to a real Atari disk. DiskCommunicator can be found at http://www.nleaudio.com/css/Files.htm

Yes, they are available at www.atariage.com

Here's the link for the pictures:

http://www.atariage.com/images/misc/dg/

There's also been a price drop from $49.95 to $29.95.

And the Demolition Man - lost Jaguar video CD (as I like to refer to it) is going to be $14.95. Also contains 5 short clips from work on the Jaguar game Commander Blood (very short video clips with no audio). This Demo Man CD was work I did at piecing together still-frame RGB pictures in RAW RGB format and RAW audio recordings. I was able to piece all the files together and match the audio up and make Quicktime videos and then convert them in Jaguar Cinepak movie format. No game code has been found yet, but I thought a video CD would at least give people a feel for what the game may have been like.

People think that this Jaguar video CD was done by Jaguar developers. It's actually the work of me of putting all the raw footage and audio together into a format that could be viewed. And putting it onto a Jaguar CD so people could enjoy it on the system it was being developed for.

Later,
Glenn

No, it isn't Basic. It looks like the data file for the interpreter program.
You can see the text imbedded in some kind of formatting characters - not
Basic, fer sure....

2750. Re: beginning assembly programming help

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-10 05:34:11 UTC
From: Steve Chamberlin <slc@pacbell.net>
Message-ID: <nZIC8.618$7y5.82290787@newssvr14.news.prodigy.com>
Source record: 29471

Thanks for the help! You're right, the ld65 linker did generate an executable, I was just looking for it in the wrong directory.

Someone else suggested trying ATASM, which I did, and I was able to get it to work fine. There are some features of ATASM I don't really like, however, so I'd prefer to use ca65/ld65 if possible.

I still have a problem with the output of ld65: it's just a plain dump of my 6502 machine code, and lacks the extra header data needed to make it an executable program. By comparison, the output of ATASM has six extra bytes of header, that appear to tell the OS where to load and run the code.

Using Atari800Win, I can load and run my ATASM executable using the "load executable" menu option, but when I try the same thing with the ld65 output file it doesn't work. So it seems that whatever I'm supposed to put in the EXEHDR segment is quite important. Or more likely, the EXEHDR segment is supposed to be generated automatically by the linker somehow, since it contains the start address of the program.

A simple working example of an Atari assembly program that works with ca65/ld65 would be great, if anyone has one.

To be clear, here's the source code and output file generated by ATASM:

```
*=$600
lda #$FF
sta $02C8
loop
jmp loop

FF FF 00 06 07 06 A9 FF 8D C8 02 4C 05 06
```

It looks like the first two bytes are some kind of executable file marker, the next two bytes are the address where the code should go in memory ($0600 here), and the two bytes following that are the ending address of code in memory ($0607).

The file generated by ld65 is missing those six header bytes, and begin immediately with A9 FF...

Any ideas how to make a working executable file with ld65?

C object files need to be run through the linker. The linker will hook them into the run time file that will handle all the house keeping tasks like passing parameters or returning them.

There's probably some niceties associated with linker you will have to do to get it to work. Something like a named Procedure at the head of the asm to get it to work. You may want to end your code with a C type return() or exit() or whatever so the linker doesn't choke.

I checked Holme's site, where most games are available
(the url I can't remember well.)
There are three or four Star Trek, Holmes has Star Trek 3.5
in his missing list, ie he doesn't have it. Wish Holmes would
put the publisher in his game list of the many games he does have,
like the missing list.
Since this is Bob Woolley, I'm sure you know how to use a sector
editor. Try to find why it won't boot. An Indus would give you
noticable 'Tonks' when it encounters error sectors, a 1050 doesn't
give you much indication of sector errors. Could be copy protected
with intentional error sectors, but I suspect some of your boot
sectors have gone bad. I use Disk Wizard (II or III?). You could
map the error sectors on the disk. It may be you need a copy of
only one sector from someone with a good disk. DW will sometimes
read a sector ok after several tries and you could then write it back
and maybe recover the disk.

>

Yep, that's one reason why I am using ATASM. It can output the code
with the proper file header so that Atari DOS's will know that it is an
executable (the two 0xFF's), and know where to load the code.

Otherwise, you will have to find a way to pre-pend the Atari DOS
executable header yourself. Might be able to do something like (syntax
will be way off, but the jist is there):

```
.BYTE $FF $FF
.WORD STARTCODE
.WORD ENDCODE
STARTCODE
# your code here
ENDCODE
```

Still it's nice to not have to worry about this...

2755. Re: AI -- StarTrek 3.5

Message-ID: <3cdc1392$1_3@nopics.sjc>
Source record: 29476

I wish...

I checked all the sectors that have data in them - there is just no executable code there. 186 sectors and no code.

It will not boot because it is using the first three DOS sectors and the flag for DOS is not set. When I set this flag to 1, the 186 sectors boot but $1540 has no useful code in it. So, it dies. As far as I can tell, there is no program code anywhere in this file, just data. All the sectors are readable.

Who is Holmes?

Bob

Hi folks,
I've just been sorting through my old 8-bit computer stuff
and found an Atari XEGS that I haven't used for 10 years! It's still
in perfect working order, still has all the relevant bits to it,
including instructions, and is still in it's original box. I have some
extra bits as well - an extra light gun, several joysticks, a spare
keyboard, a PSU, and the atari data recorder - all in good working
condition.
I have no need of any of it any more - Best offer secures the lot!

Talk soon

2758. atari800win and joystick problem

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-11 00:38:43 UTC
From: Gordon Abbot <gabbot@clinic.net>
Message-ID: <3CDC6811.5D535E40@clinic.net>
Source record: 29479

I am trying Atari800win version 2.6 and everything works fine except my joystick only moves the object left and up. The keyboard moves everything as it should. I tried it with a couple of versions of atari800win and all did not support the jotstick.

I have a 1.2 gig athelon. (second computer since my atari).

I also have pcxformer which I purchased long ago with sio2pc (a fine bit of work) to transfer my atari disks to my pc. The joystick works fine with xformer, but I would like to use Atari800win because of its additional features.

Any suggstions of where the problem may be?

I use Hias' AtariLink to put .ATR files onto DD MyDos diskettes with the PC 5.25 and made a quick Atari Basic program to write the image onto a SD disk. This little utility is on my site as ATR2ENH about 1/3 of the way down. It will do enhanced 1040 sector images or error out and stop after #720 on standard SD. Only caveat is the expectation of 2 drives (I use a ramdisk) as I never wrote the disk swapping code. Swapping requires some POKEing to the DCB and a USR(call to toggle the drive from SD to DD for each pass. We can update it if you want or need to...

2760. sio2pc usage question

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-11 02:03:08 UTC
From: Steve Chamberlin <slc@pacbell.net>
Message-ID: <wZ_C8.83$YU5.11804733@newssvr21.news.prodigy.com>

Hi,

A possibly stupid sio2pc question: How is it possible to copy disks between a real Atari drive and the PC, given that only one can be connected to the Atari computer at once? The sio2pc web page mentions that sio2pc can co-exist with real drives in the Atari daisy chain, but if I understand correctly, the sio2pc cable must be attached directly to the Atari computer and not to one of the drives. Since the Atari only has one SIO port (or at least my 130XE only has one), that would seem to prevent having the sio2pc cable and a regular Atari drive cable both connected at once.

Thanks!

No, it just has to be the last thing attached unless you made up a special
one with a through/second male socket.

A word of warning though. I made a few tests with different numbers of
drives attached and had problems with reliability. As near as I could tell
it was a contact problem causing low voltage across the board for everything
from the +5V power to the signals.

You're working under a false assumption. I've run a system with an Atari
800XL, Indus GT floppy drive, and a laptop x86 with an SIO2PC cable
connected between the laptop and the Indus, and it works fine. I've run
it with both the Indus as drive 1 and the Indus as drive 2 (with the
SIO2PC software running drive 1). It works both ways.

Nope -- at least, my system hasn't shown any signs of problems. If
there's some danger in such a configuration, like the potential to
damage some hardware, I'd certainly like to know about it.

Instead of being targeted to one specific platform, ld65 is a generic 6502 linker that is configurable so it can be adapted to different platforms, the atari machines being one of them. As I said before, this brings additional complexity which may get in the way if you are a beginner. On the other side, there are many nifty features not available elsewhere, so if you are a experienced coder, chances are that you will like ld65.

Regarding your special problem: Because ld65 is not atari specific, it will not add such a header - but it is capable of doing so. In fact, the EXEHDR segment that is listed as first segment in the config file does supply such a header when using the C compiler. Here is the necessary code snippet taken from the C startup file:

```
.import __CODE_LOAD__, __BSS_LOAD__
.segment "EXEHDR"
.word $FFFF
.word __CODE_LOAD__
.word __BSS_LOAD__ - 1
.code
```

The __CODE_LOAD__ and __BSS_LOAD__ symbols are generated by the linker, so they refect the actual settings regardless of the number modules linked into the executable. The code above will put 6 bytes in a segment called EXEHDR that is placed at the start of the output file by the linker config. You can move this snippet into your source file (the exact location does not matter), or place it into a separate module and link it to your executable.

> A simple working example of an Atari assembly program that works with
> ca65/ld65 would be great, if anyone has one.

While I know a few things about cc65/ca65/ld65, my knowledge about atari specific things is unfortunately rather limited.

Regards

Uz

I'll mention that your sio2pc/ape cable has to have the diode if
you are daisy chaining in a real disk drive. I remember something
in the document about sio2pc that some people may not put
the diode in the interface if they never daisy chain a real drive.
I think it is a safety thing, protects the drive or something.
I'm sure R. Cortese could explain it.

Seems like some emulators need a joystick config file.
You have to 'center' the joystick. My old joystick has little
tabs to center the joystick. If it isn't centered, then you may
only get the one direction problem you're describing. Other
than that, I don't know much Atari800win 2.6.

I haven't had any such problems with mine. Perhaps my Indus GT is less
sensitive to this than whatever you've got, or maybe it varies with the
design. (I have no idea what design mine is; I bought it from a guy on
eBay.)

Holmes has about the best collection of A-8 game on the net,
along with ftp.spudster.org which is the CTH archive.
(cut and paste).
http://homepages.paradise.net.nz/atari/
186 sectors with data in them, no code, and it doesn't boot unless
you set a DOS flag.
This disk may have the production lable, but may have been written
over or something.
What you really need is someone with a working copy of ST 3.5.
I don't have it. Maybe someone? Could it be a data disk and
the boot disk is another disk, or on the flip side?

Joysticks have worked happily on Win and Plus since the 1st release
IIRC but a few things people forget to do is have the correct version
of DirectX or above, to calibrate the stick (yep, sounds silly but
many people do not calibrate the stick in Windows in the control
panel)

Also some sticks may cause problem driver wise..

During my tester duties on Plus I have tried 4 sticks / pads and never
had a problem. Oh, I know this is also going to sound daft but a few
people have presumed the emulator defaults to use a joystick, nope you
do have to set it to JS :-)

>I also have pcxformer which I purchased long ago with sio2pc (a fine
>bit of work) to transfer my atari disks to my pc. The joystick works
>fine with xformer, but I would like to use Atari800win because of its
>additional features.
>
>Any suggstions of where the problem may be?
>
Apart from the above can you tell me what JS you use and does it need
a driver, does it also quite happily calibrate in Gamepads?

If so then the emu just uses DX to confirm a pad is there so it should
work fine. You might want to get the latest version of Plus as it's
both a better core than 2.6 and has many enhancements.

Are there any online Atari programming manuals? (6502, hardware reference manual, etc.)

I'm interested in finding online 6502 assembly language tutorials. Do any exist? Most of the books haven't been published in many years, and I can't find any in my local used book stores.

> so I'd prefer to use ca65/ld65 if possible.

It can definitely be done, this is not the best example (especially
for a beginner), but I've got some code on my webpage that assembles
with ca65/ld65:

http://a8jdpeg.atari.org

It creates a program that can be loaded using the DOS 'L' option. It
uses several segments and sets the load, run and init addresses. The
basics behind it though are:

```
;; bytes 3-6 in the DOS header, they specify the start +
end
;; addresses of the code/data to load
.ADDR segstart
.ADDR segend-1

.ORG $2000 ; or wherever you want your code to load

segstart:

; put your code here

RTS
segend:

;; file header data - sets first 2 bytes in header ($FFFF)
;; needed at the start of a DOS executable file.
.SEGMENT "EXEHDR"
.BYTE 255, 255

;; run address - sets the run address segment at the end of the
;; file you need this if you want your executable to
actually run
;; as opposed to just loading code/data into memory.
.SEGMENT "AUTOSTRT"
.ADDR 736
.ADDR 737
.ADDR segstart
```

I reached that solution mostly by experimentation though, so Ullrich's
method is probably better.

Like the people using ATasm I've got it set up so that typing 'make'
under Linux generates an ATR file, then it's just a case of opening
the file with an emulator. Actually you just have to run the emulator
and attach the ATR file once.

You can find a couple brief, beginners, tutorials on my site, under
Assembler Editor.
I think they will list the op codes and addressing modes, which
could get you started, and how to compile a source file.
www.en.com/users/russg under Assembler Editor.

There are tutorials for Mac65, more advanced, you can find in the CTH
archive at ftp.spudster.org. Probably best to download the 'ALL.TXT'
and hunt for the documentation and text file.

You might find 'Mapping the Atari' very useful.
at www.atariarchives.org (or .com?).

I found De Re Atari on a UK site also, which has good info.
http://www.runtime.demon.co.uk/Systems/Atari/Books/

Hello,

When you say "exe" files, do you mean Atari 8-bit files? If so I would
think APE would do that. I have done it also, converting raw Atari
8-bit files to DI images to be used with 800XLDJ. If I wanted, I could
convert the DI files to ATR files using a simple little program.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

2786. Opinions wanted - .xex or .atr for binaries?

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-14 17:40:26 UTC
From: damfino@rochester.rr.com
Message-ID: <ef53b03c.0205140940.7d3835f2@posting.google.com>
Source record: 29357

Hi folks, I've got another fellow now helping me with the next update to the TOSEC Atari 8bit database, and we're trying to decide the best way to deal with individual binary-file games. Currently, some have been converted to .atr format with the MakeATR utility (ie, K-Boot), while many more currently exist in a very old executable-only TOSEC database. Apparently Atari800Win (and others?) recognize an .xex format, which would be for an Atari 8bit executable. There are two options:

1) Convert everything to .ATRs. The advantage is that there will be one listing for everything, so if someone's looking for a specific game, they won't have to check both the .atr and the .xex collections. Another advantage is that this will allow people to keep their existing binary-to-atr conversions. The disadvantage is that if someone wants to have the executable by itself, it will need to be re-converted back to a .exe file. (The filenames will say which programs are conversions.)

2) Have two distinct databases, one for .ATRs and one for .XEXs. The advantage is that everything will be in its native format. The disadvantages are that there will be two places to check if you're looking for a specific game (though I suppose you could leave both in one directory, but it wouldn't work if you zip everything to individual files), and that if someone already has programs that have been converted, they will be "unknown" and it might be confusing to an Atari newbie why they used to be recognized but aren't anymore.

I was originally in favor of option 1 but I'm starting to waver, so I thought I'd do a quick informal poll of the community and see what you all think. How would you like to see this done?

2787. Game by Avlon Hill, name help.....

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-14 18:22:19 UTC

it was by Avlon Hill and possibly called Sink The Bismarck, you would sail around a grid as part of the British fleet and try to sink the aforementioned ship. the players and the computers ships were displayed as letters on a grid. I can't find any info on the net so I guess it's the wrong name.
has anyone got any ideas?

tia

2788. Re: printer interface

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-14 19:21:17 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <NsdE8.755$I82.80831@newsread1.prod.itd.earthlink.net>
Source record: 29359

Hi, Jim;

Eight DIP switches numbered 1-8 left to right.
Up is on; should be marked near switches.

#1 is Graphics control:
ON prints text, converts control graphics (<32 and >127) to ATASCII shapes.
OFF passes all text and codes to printer transparently.

#2 is Auto Line Feeds:
ON adds a line feed to each carriage return.
OFF sends only the return from the interface and relies on the printer to
supply the line feed.

#3 is End of Line conversion:
ON passes the 155 unchanged; preferred OFF without extraordinary
circumstances.
OFF converts the ATASCII 155 EOL to a 13 printer carriage return. Normally
preferred.

#4 is 7 or 8 Bit ASCII:
ON converts all data to 7 bit by setting the high bit to zero. Prohibits
printing inverse (>127) ATASCII graphics, and is only needed with some old
software which sets the 8th bit to one.
OFF passes all 8 bits as received.

Xetec recommends setting #1- #4 OFF for all packaged software; exception may
be #2 if printer is not configured to give line feeds.

#5 - #8 are Printer selection control; 18 specific models were listed with
appropriate settings. Epson, Gemini and Star models set 5, 6, 7, and 8 to
OFF; all non-graphics daisy wheel types set 5-8 to ON. Okidata sets #5 ON,
NEC/Prowriter sets #6 ON, Legend/Blue Chip sets #7 ON, Axiom/Banana set #5 &
#6 ON.

Special Codes to interface in Graphics mode SW #1 ON.
ESC 6 selects 6 lines per inch
ESC 8 " 8 lines per inch
ESC T selects transparent mode as if SW #1 OFF
ESC G select graphics by cancelling ESC T
14 (Ctrl N) select expanded width characters
20 (Ctrl T) select compressed width characters
15 (Ctrl O) cancel expanded and compressed widths
*Note: may not function with all printers.

Use with 1200XL requires modification to supply +5V

Message-ID: <3ce1778a$1_2@nopics.sjc>
Source record: 29360

I have my old version SIO2PC behind three drives (2 XF551s and a 1050) along with a P:R connection run from a two-way splitter. It all works fine - but, like you said Rick, the connections are a little flakey after sitting for a time. The drives and P:R work, just the SIO2PC is apt to fail from bad connections.

Paul,

Thanks for reminding me to always look for the simple solution before going to the more complex. I had not calibrated it in a long time and it was out of calibration. I thought it was not the problem since it worked in other programs and especially with pctransformer.

All works fine. Other than I am a little embarassed.

Gordon, do not feel the slightest bit embarrassed, I have done the
same myself and I'd bet a 100&1 others in here have :-)

The reason it worked in other progs is that they sample the js
directly and create their own table for it rather than relying on DX
to be perfectly calibrated.

Glad it's fine and dandy, hope you picked up the newer Atari800win
Plus and keep an eye out for newer versions as they slowly but surely
arrive.

Support for the hi-speed alpha menu's loaders and a sector counter are
but two up and running features for the next one.....

Bob,

Star Trek 3.5 was a basic program. Have to see if I can find it. I used
to modify the game back in the 80's so that I could have 1,000,000 energy
points verses the 3,000 you could possibly have. ;^)

Hey!

Been lookin for a copy of "Action".
Has it gone PD? Where can I get a copy?
Gave mine away about 12 years ago!

As of now the release of Daemon's Gate was a bust. I have lost
thousands of dollars, hundreds of hours and received negative E-mail.
I spent over $70K buying all of the computers from Atari
Engineering whem they layed everyone off. I have many more unreleased
Atari titles. However for now, all future releases are on hold and
I'm not shipping anymore Daemon's Gate.
For those faithfull Atari fans that did buy DG from us please pick
2 titles for each Daemon's Gate you bought and I will send them
to you new in the box at my cost.

Maybe if the source code is available then someone could finish those
titles.
That way there should be more interest.
Which other titles are there? Relief pitcher etc.?
Assuming of course that would be legally ok...

Are you sure it wasn't made by SSI and called 'Computer Bismark'?
SSI and Avalon Hill were very similar and AH was eventually bought out by
SSI or absorbed or something.

Since recent emulators can directly load executables there's no real
need for option 1 anymore. So I vote for option 2.

I would like to see everything as an ATR. It makes it so much easier if
everything is in one format!

And its easier to use an ATR from a real Atari using APE etc, can just boot
the disk rather than have to mess about with DOS menus.

To be honest things are already a mess, the last version of the TOSEC db had
stuff in DCM format ATR firmat and there were EXE's and BINs in amongst that
lot!

>2 titles for each Daemon's Gate you bought and I will send them
>to you new in the box at my cost.

I'm really sorry to hear this, especially since I was going to try to purchase a copy next week. I realize that it is not a complete game but I still wanted to see what they were doing and see if I could get any ideas from it. I think that maybe everyone's expectations were too high on this release. The game is obviously functional but not complete (which is why it is an unreleased game) and if people had purchased it with that idea in mind I don't think that you would have had as many complaints.

In the future you may want to run a small batch (or even a dozen hand made carts) and offer a special release to past customers or people that you know would be good beta testers in order to get their feedback. If they state it's totally unusable then don't release it. If they can provide you with a list of limitations or problems then list those issues up front on your web pages so people can see them prior to purchasing it. I'm sure some people would still complain because they don't want to believe what they read and want to think that it will still be perfect but it should cut down on the number of complaints.

I compliment you on trying to release the game. With so little new coming out for the Lynx & Jaguar systems (songbird can't produce everything) it nice to be able to get what we can. Hopefully you will continue to try to provide any new stuff that you have and not let it fade away into the past as with so many other projects that were in the works but never saw the light of day.

Just my 2 cents for all it's worth.

Ok, ok, I've spoken too soon. It's a 2600-like machine, probably not 100% compatible with the original, and those games are ports. It's all over slashdot.

Apparently you haven't seen the current version of the TOSEC db. :)

I did a TON of work cleaning it up (I didn't do the original), head
over to TOSEC's site and check the "Atari 8bit Games - ATR" database
to see the current state. I think you'll find it a huge improvement.
No more DCMs, XFDs, etc; all names follow the "TOSEC Naming
Convention"; and it recognizes a lot more stuff.

I guess it comes down to emulators vs using APE... if you're using
emulators, the .xex files are great, if you're using APE, they're a
pain in the neck, and as soon as you stick a bunch into a megaboot
disk to run through APE, you lose all the info that's in the long
filename...

The other option is to have databases for both, but that's incredibly
redundant, and pointless unless a particular game will only work as an
executable and not as an ATR conversion. But, if you go by the idea
that the DBs are help to organize what you already have (instead of
using them as a checklist for collecting all the games - but no one
does that, riiiiight?), then that might be helpful...

I like this idea. I can always convert the ATR to DI images and use
them with my 8-bit peripheral emulator. I also have programs that can
extract the raw files out if I so choose.

You make some good points, Glitch. I hope Bruce doesn't go
heartbroken from this failed release, and heeds some of your
advice for the future. To be honest, I don't know what Bruce
was expecting. Foremost, trying to use his ignorance of a game
as a way to get people to believe it is complete, thus tricking
them into buying it. Bruce, of course you're going to get negative
E-mail then, when people realize that you were misleading them,
whether intentionally or not. Just give us the facts, Bruce,
and that leaves much less to complain about.

I'm also somewhat offended, that Bruce is suggesting that only
the 'faithful' Atari fans actually bought Daemon's Gate from
him. To the contrary, if you ask me. It was not bought in mass
quantities because, as a community, we have grown into more
intelligent consumers. And this bust of his has proven the fact.
Just because we are thirsty, doesn't mean we will be grateful
to pay large fees for a glass half filled with water, whilst
the vendor assures us that it seems to be full, but he really
hasn't had enough time to make sure of the fact. If the glass
is only half full, be honest with me. I can still appreciate
only that, as long as it's what I expect when I buy it.

Don't get me wrong, I do have some appreciation for Bruce's
efforts. Surprises are great, but in the future I hope he will
discuss with the Lynx Community his future prospects. Then
we might decide together what is in our best interests, before
Bruce invests so much time and effort in the matter.

Realize, I've got nothing but love for you, Bruce. But we need
to be critical of the ones we love, so they do things better
the next time around.

Sorry for the ranting.

-vick

I use the emulator on the Dreamcast but also use a real Atari with ATR's.
ATR is definitely favourite for me.

I prefer to use the ATR's on the emulator also. I am at present working my
way through the ATR's documenting what works and what doesn't for use on a
DC emulator site. I won't be doing the same task again on EXE's!

Please keep us informed of what you do :)

Here's another guy who sells them:

http://strony.wp.pl/wp/j131atari/help.html

I ordered one from him. It arrived promptly (shipped airmail; I'm in
the US), seems well constructed, and works fine.

Sorry for getting slightly off topic but I'm wondering how many people
did that same task before.
Some time ago I dumped part of my own collection to ATRs and in addition
downloaded some archives from the web. I spent quite some time comparing
versions and writing down emulator switches needed to get the files
working. One problem was that with only one minute per game on one hand
you don't really know whether it would be fully functional to the end
and on the other hand even with that one minute it takes quite some
time to check several thousand files. So after maybe twothousand files
and an unsuccessful attempt to share the task with others I gave up.

Anyway good luck for your try
Gerhard

Well, at this point, the TOSEC databases tell you what works in
Atari800Win - if it doesn't work, it's marked as a bad dump but kept
around in case it is a problem with the emulator. So far, it looks
like the compatabilty rate is extremely high so it's really not a
problem. I wouldn't think it'd be worth documentating what does and
doesn't work with the DC emulator, since it's an ongoing project and
theoretically after a few revisions it should be able to match the
Windows version for compatability.

BTW, I got an email from someone who was having trouble finding the
current TOSEC Atari 8bit db - it's on this page:
http://tosec.retrogames.com/index.php?sect=database&s=all
The one you're looking for it Atari 8bit Games - ATR. It's also
included with the distribution of TUGID, their ROM manager, though a
couple of the unusual flags confuse it a little bit.

Well, so far the majority seem to be in favor of making everything an
ATR file... that seems to be the best overall solution in my opinion,
and since they'll be marked with a (file) tag in the filename, it
should be easy enough for anyone who wants to to seperate them out and
convert them back to .exes...

Lets not get lame guys, everthing in atr format?
I dont like wasting space and thats what would happen if you do just that.
There are lots of util's that will make a ATR file and insert your xex or
com files, then just look for a 3 sector file loader.

Wasting space?

We're talking about 494 bytes here! Half a K. I think the increase in
space is more than offset by the increase in managability and ease of
use with any emulator... there are reasons to consider not using ATRs
but I think space is pretty low on the list.

Source record: 29401

I was wondering if someone could help me. Im still putting together a collection of my old software for my old 800 XL onto an emulator for my PC. The problem I'm having is that one of my old favorite games, Star Fleet 1, requires the game documentation to play it.

Ive searched several good 8-bit sites on the web, but I can't find the documentation for the Atari verision. After contacting a webmaster for one of hte sites, he directed me here and said ya'll might be able to help.

Does anyone have a scan of the documentation, or perhaps have it in text format with the gaem codes highlighted for me to use? Any help would be appreciated.

2831. Re: .DEM files...

Source record: 29402

Well,
on the Pooldisk too these *.DEM files are a) just *.EXE files where dem
is short for demo or b) just *.ATR images where dem means demo again.
since I do not know where you found these dem files it might also be
possible that they are discommed (Diskcommunicator 3.x) files. So, try
using them as EXe files, if it fails try them as ATR and finally try
unpacking them with diskcom. If all 3 things do not work, use a monitor
program to examine whats inside... -Andreas.

Hmm,
all Startrek programs I know, except the Sega cartridge version, were
written in Atari Basic (of course some cool guys compiled a few of
them). At the moment my collection has 5-6 startrek files, excluding the
sega one. startrek 3.5 by ai is it the same as starflite ?!?
-Andreas.

P.S.: for your Basic program use an Autorun.Sys generator to load it
automatically...

2835. Atari Ramdisk info Vers. 1.4 ...

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-17 17:23:55 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CE53CAB.7B5C317E@students.uni-mainz.de>
Source record: 29406

Hello Atarians, hello Michael Current,
once again here is a "small" update of the Atari Ramdisk overview.
This time the text includes only a short update but therefore a huge
correction of many typos I did in the last update. Hopefully these
typos are all wiped out now... -Andreas.

3.7 Atari Ramdisks - a short & very incomplete Overview:
(This is version 1.4 from May 2002)

Right from the start of the Atari 8-bit computer era in the late 70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM
extensions and enhancements, just to save some money. Also a lot of
firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This short and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to see
this text & info growing. For now let us start here, the info-section
is divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);
4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the RD);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in

their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use
a small setup program to setup any kind of RD. Now let me begin:

3.7.1 Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k
RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible,

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,
32k and 64k (where only 52k can be used). These are no Ramdisks,
sorry for the confusion !! But maybe the 64k Ramboard can be patched
in some way to gain a small 16k or 32k Ramdisk (48k RAM + 16k RD or
32k RAM + 32k RD) ?!?

- ...

3.7.2 Atari XL/XE Ramdisks:

Due to an excellent article by John Picken, I`d like to present the
following overview first (found this info at Jindroush`s homepage):

RAM BANK ACCESS TABLE 64-1024K

PORTB Available on Type

E3,E7,EB,EF 1,2,3,4,5,6,7,8,9
C3,C7,CB,CF 2,3,4,5,6,7,8,9
A3,A7,AB,AF 2, 4,5,6,7
83,87,8B,8F 3,4,5,6,7
E1,E5,E9,ED 5,6,7
C1,C5,C9,CD 5,6,7 (short
A1,A5,A9,AD 5,6,7,8 overview)
81,85,89,8D 5,6,7,8
63,67,6B,6F 6,7
43,47,4B,4F 6,7
23,27,2B,2F 6,7
03,07,0B,0F 6,7
61,65,69,6D 7
41,45,49,4D 7
21,25,29,2D 7
01,05,09,0D 7

Type Upgrade Mapping
1 = 130 XE
2 = 256 XL Bucholz/Peterson/Rambo
3 = 256 XL Newell
4 = 320 XE Peterson
5 = 576 XE "
6 = 832 XE "
7 = 1088 XE "
8 = 832k+ " (BASIC on)
9 = 576 XE " " "

Note 1: The documentation by Scott Peterson on his upgrades indicates
that
only 128k is available in XE-compatible mode (Types 8/9 above). Two more
64k blocks are available as indicated with 832 or 1088k machines though
not
all RD handlers will find and use them.

Note 2: Based on an article by Jeff McWilliams in the April 1993 edition
of
AC, it appears the Newell 1-meg upgrade is mapped similarly to the
Peterson.

Note 3: With version 2.1 of the SpartaDOS Wedge, Ed Bachman describes a
simple fix for Peterson upgrades to reenable Antic access to extended
RAM.
It is definitely worth checking out, even if you don't use SpartaDOS.

Again thanks to John Picken for this information.
Now let`s continue with my own overview table (long overview):

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not
reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard
convention
as the majority of ramdisk users don't want bit 4 counted as a control
bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the
'on'
bit for ANTIC's access to the extended memory for 'compatible' (to
130XE)
machines as well. If bit 5 does show up in a bit use table, one can
only
assume that this is an incompatible machine which doesn't have or use
ANTIC
access at all. In that special case, bit 5 is then available for use in
switching in the various banks and thus gets counted as a control bit in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte Chips (west), new=32kbyte Chips (east);
XEs made in China have faulty GTIAs => replace them!;
standard Atari ramdisk; Antic access: YES!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 81,85,89,8D,A1,A5,A9,AD,C1,C5,C9,CD,E1,E5,E9,ED;
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes also a test program);
seems to be incompatible to most other 192k/256k Ramdisks (?);
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41

2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: yes!, Basic: "no" (1200XLs don`t have Basic built-in!);
Antic access: no! (can be upgraded to 1088k / 64k RAM + 1024k RD);

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS:Missile Command=YES!;
no use of any switches!; Antic access: YES!

- Megaram 1 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David,
older Compyshop version; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Megaram 2 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 64kbyte Chips x4 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David,
newer Compyshop version; fully compatible to Megaram 1;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
Compyshop`s Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Megaram 3 K. Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four (or more?) switches; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF (most common banks);
Notes: uses 64k as main RAM and 192k as Ramdisk/extra RAM;

normally NOT compatible to Peterson/Buchholz/Rambo XL Ramdisks;
*** Russ Gilbert mentioned that his Newell RD uses 83,87,8B,8F
as main Ram and A,C,E as extra Rambanks - thus it is compatible
to Peterson, Buchholz and Rambo XL. Looks like Wes Newell changed
the design of his Newell Ramdisks from time to time. However,
most 192k (256k total) Newell Ramdisks are not compatible to the
above (at least all my docs, manuals and e-mails say so). But
there`s no need to worry about, just read the nice article by Craig
Goranson and find out how to install a small patch to make even
incompatible Newell RDs compatible to Peterson/Buchholz/Rambo XL.***
built in Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F

81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: made in Poland; compatible to Newell & S.Peterson (?)
Atari Basic: no!, XL/XE Selftest: YES!, Antic access: no (?)

- missing info for the following Ramdisks:
Bob Woolley Ramdisks, 600XL Ramdisks, Rambo XL (512k by ICD),
some more Compyshop Ramdisks as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

3.7.3 PBI-devices (XL=parallel Bus, XE=cart. Port+ECI):

Name Vendor Size Area
Banks Bits Port Note

- no information yet!
- missing info for the following Ramdisks:
ICD MIO (256k, 1024k), Yorky XL (256k), Turbo-Freezer XL (256k),
the Atari 1090 (this one should also have had a 64k extra RAM
expansion card), R.David/K.Peters Romdisk (512k) and many many
other PBI devices...

3.7.4 other "Ramdisk" types and devices:

Name Vendor Size Area
Banks Bits Port Note

- no information yet !!
- missing info for the following types and devices:
Flashrom (512k), Ramcart (64k-4096k) as presented in ABBUC magazine,
Rambox (64k-256k), CP/M card (with 64k extra RAM avaiable), ATR 8000
(also had 64k extra RAM), Turbo 65816 (or 65801 / 65802), ARGS Romdisk
cart. (64k) and many other types...

For this fifth edition special thanks go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl and Ron Hamilton for
sharing their info with me. Also thanks to John Picken for writing an
excellent article about ramdisks and cartridges (especially about
bank-switching, which both devices can do). And thanks to Jindrich
Kubec (Jindroush) for presenting this fine article on his homepage...
Thank you Folks !!
Well, thats it for today - there is still a lot of information missing,
I know, but any help is appreciated. If you have some more information
or
other things that might help, let me know. Please do also send
corrections
(I am a novice in this subject, so there will be quite some updates and
corrections nescessary). Thank you - Andreas Magenheimer.

2836. Ramdisk support software...

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-17 17:27:09 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CE53D6D.B25CB1C6@students.uni-mainz.de>
Source record: 29407

Well,
here is a new list of some Ramdisk supporting software (last time I
forgot to send this text I think). Have fun reading... -andreas.

8.12 Ramdisk-supporting Software:
(This is Version 1.4 from May 2002)

Well, I will only list those programs here, that have built-in ramdisk
support. Why? Simply, because most if not all PD programs can support
a RD, as soon as the user a) has a special DOS or RD driver or b) has
a special OS inside the computer or c) has any kind of special and
non-standard hardware. Just one example: With the use of QMEG+ OS it
is possible to freeze ZORK (or any other protected / unprotected
program)
into the RD, then re-direct the RD as being drive 1 and finally boot
Zork off of the Ramdisk, allthough Zork does not support a RD in any
way.
The same funny things can be done to other copy protected programs and
especially to unprotected public domain programs...
Ok, enough said, let me begin:

8.12.1 DOS programs:

- Atari DOS 2.0 (selfmade RD drivers for Axlon and XE avaiable);
- Atari DOS 2.5 (driver for XE-RD and various selfmade drivers);
- MyDOS (supports Axlon and XE compatible Ramdisks up to 1MB);
- Sparta-DOS (supports XE compatible RDs and others up to 1MB);
- Happy DOS II+D (supports XE compatible Ramdisks up to 256k);
- BiboDOS (supports XE compatible RDs up to 256k);
- TurboDOS (supports XE comp. RDs, MIO, Irata, etc. up to 256k)
- TopDOS (supports XE comp. RDs and Axlon RDs);
- BeweDOS (supports XE comp. RDs and Rambox);
- SuperDOS (supports XE comp. RDs up to 256k)
- guess there are dozens of other DOS versions that support a RD...

8.12.2 non-DOS programs:

- Synfile (+) by Synapse supports Axlon-RDs;
- Syncalc (+) by Synapse supports Axlon-RDs;
- Synhome (+) by Synapse supports Axlon-RDs;
- other Synapse applications should also support Axlon-RDs;

- A.R.-The Dungeon by Datasoft supports 48k, 64k and 128k (XE-RD);
- Paperclip-II by Batteries Inc. supports 130XE-RDs;
- Atari-Writer-Plus by Atari supports 130XE-RDs;
- Atari-writer-80 by Atari supports 130XE-RDs;
- A-Text 130 or Austro-Text 130 supports 130XE-RDs;
- Page-Designer by XLent supports 130XE-RDs;
- Type-Setter by XLent supports 130XE-RDs;
- other applications by XLent support 130XE-RDs;
- 4bit-Sampler software by Mirage/ANG supports 64k, 128k and 320k
memory;
- The Brundles by KE-Soft supports 64k, 128k and 320k memory;
- Adalmar by Power per Post supports both 64k and 128k? memory (?)
- Megablast 1 by Thorsten Karwoth supports both 64k and 128k memory;
- Basic XE by OSS/ICD/FTE also supports 128k memory (some
statements like "extended" require extra RAM when used);
- Extended Atari Basic (PD) by ??? also supports 128k memory
(some statements like "Bank x" require extra RAM when used);
- Extended Turbo Basic (PD) by ??? also supports 128k or more memory
(some statements which choose a certain RD-bank need extra memory);
- Textpro 5.x has some built-in commands/macros which require extra
memory
when used (Textpro-Addins *.ADN and other macros need at least one
extra 16k RD-Bank; if you avoid using them a 48k/64k Atari is enough);
- Howfen DOS (1.x?), 2.x, 3.x and 4.x supports 128k and more memory (but
also works well on a 48k or 64k Atari, however some tapes cannot be
copied on a small 48k machine); uses a menu with up to 20 entries;
not compatible to DOS 2,3,4 or Sparta/Bewe-DOS; Howfen and similar
images (like Multiboot, Alphaload, etc.) do not work on most
emulators!;
- Howfen Tape-to-Disk, the multi-stage C-D-Copy and C-Simulator supports
128k and more memory (thus you can copy a whole tape in one pass; if
you
merely have 48k or 64k you will need multiple passes and have to
append
each part to already existing parts; however some Tapes, with
mainparts
bigger than 48kbytes cannot be copied to disk on a "small" 48k
machine;)
this program creates "Bootdisks"; images do not work on most
emulators!;
- Fampy 2.3 (Bootdisk), a MD8 player by Friday-Software supports 128k
and
more memory; needs a minimum of 64k memory, but supports many
different
Ramdisks; does not like SpartaDOS format; works well with 90k, 130k,
180k and 360k disk densities (DOS 2.x format only);
- Fampy 6.1i+ (ML-File), a newer MD8 player by Friday Software supports
128k and more memory; needs a minimum of 64k memory, but supports many
different Ramdisks; works well with 90k and 180k densities (DOS 2.x
formats), not so well with 130k (not DOS 2.5, not MyDOS, maybe

DOS II+D only?) and not at all with any higher density, nor Sparta
DOS;
- Midi-Player by Ireneusz Kuczek supports 128k or more memory (there is
a maximum of 300kbytes buffer space available for midi files);
- Midi-Recorder by Ireneusz Kuczek supports 128k or more memory (well,
the buffer space is unknown yet);
- Midi-Sequencer by Maciej Sygit supports 128k or more memory
(buffer space unknown);
- Midi-Pattern-Editor by Radek Sterba supports 128k or more memory
(buffer space unknown);
- MSC-IDE Interface software by M.Belitz and S.Birrmanns supports
128k or more memory (on 64k machines some programs will erase
and occupy the Ram area at 4000-7FFF);
- Diskcommunicator 2.x and 3.x by Robert "Bob" Puff support extra RAM
and/or Ramdisks of XE compatible machines (answer the questions with
"Y"es and your extra memory will be used as extra RAM, answer "N"o
and it will be useable as a Ramdisk -D8: or D9:- if available);
- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means only 128k (for more extra Ram you have
to change the program, the DOS or the RD driver);
- 320k memory means any (?) XE-compatible RD with 64k RAM
plus 256k extra Ram / Ramdisk;

Thats all for now. Thanks to Russ Gilbert and Lee Barnes for sharing
some
info with me. Any further help or info is welcome !! Andreas
Magenheimer.

EoE or EoF.

2837. Software that requires a RD...

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-17 17:33:18 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CE53EDE.DBCA3DEC@students.uni-mainz.de>
Source record: 29408

Hello Folks,
once more here is my list of software that requires a RD. I included
portions of german PD libraries, like ABBUC and HAPS (that are still
alive!) at the end. hope you won`t mind (they also carry lots of english
and american PD stuff). -Andreas.

8.13 Atari programs which require extra Ram / Ramdisk:
(This is version 1.4 from May 2002)

The memory values given are not always fully correct, since I do not
have all kinds of memory settings or Ramdisk types. At the moment I
merely have machines with 64k, 128k and 320k memory. Thus I cannot
tell if a program may work with 192k or 256k (or more than 320k), since
I do not have such machines. Any help or correction is welcome...

8.13.1 non-Demo programs:

- Degas-View XE by MAT*RAT (in memoriam: Matthew Ratcliff)
requires 128k memory (a 130XE or compatible is enough);
- The Cruncher 5.0 by MSL/Magnus Software Limited requires a
minimum of 128k memory (supports up to 320k? memory);
- Code-Cruncher 2.x and 3.x by Adam Bienias require a
minimum of 128k memory (supports up to 320k? memory);
- Lightraces from Power per Post exists in a 64k and a 128k
version; the 128k version merely works with 128k memory;
- The Wedge 2.x by Ed Bachman needs 128k memory (a 130XE is
enough; but: Antic must have RD access!!)
- Space Harrier by Sheddy needs 128k memory (130XE is enough);
- The Works by Tom Hunt needs 128k minimum memory (supports
also bigger machines up to 256k, but no CS Ramdisks);
- T-34 by Mirage/ANG needs 128k memory (a 130XE is enough);
- Mister X by Power per Post needs 128k memory (130XE);
- Castle of Blackthorne by Thimo Graef needs 128k memory;
(a simple ripp-off of Dungeonmaster & Bardstale, written in
Turbo-Basic XL; unfinished and thus very limited playability);
- Gizmo`s Castle by Black Panther is available in two versions:
the 64k version and the 128k version; if you have the 128k
version you will need a 130XE or compatible machine;
- Oelbaron by ??? (author unknown) also comes in two versions:
a 64k and a 128k version; a 130XE or comp. is needed for 128k;
- Boss-XE by Mirko Sobe needs 128k minimum memory (XE or bigger);
- Boss-X by Mirko Sobe needs 128k minimum memory (XE or bigger)

(works best with MyDOS 4.5x, supports Subdirs & Harddisks);
- ATOS the Mega-Multimedia GUI / Desktop by Tom Hunt requires
a 16Megabyte Harddisk partition or any XL/XE Atari with a
big Ramdisk (256k, 512k, 1024k) and/or a big Floppydrive (180k,
360k, 720k, 1440k densities); this mega-application will not
work on a non-expanded 64k Atari with only 810 or 1050 disk
drive; works best from Harddisk, should also work (slower)
from big floppies and/or big Ramdisks (untested yet);
- MTOS 1.0 and 1.1 by Tom Hunt need 128k memory (XE), there is
also a 256k version of MTOS (64k RAM + 192k RD);
- Snapshot by ??? (author unknown) needs 128k minimum memory;
- XL2 by J.K. Picken needs 128k minimum memory; supports also
bigger XE-compatible machines of up to 1Megabyte (?);
- the CTH-Sound-Utility by Tom Hunt (a Wave+DIG Player) supports
64k, 128k, 256k, 576k and 1088k machines; uses 16k RAM+RD for the
Digi-Sound, thus a 64k machine (where only 16k can be used) is
much to small!; does not support 320k machines, nor Compyshop-RDs;
- Datei 4.0 and 4.1 by ??? (author unknown) both support 128k (XE)
and 320k (Compyshop) machines;
- various Filemanagers/Filecopiers support XE-comp. Ramdisks;
i.e. you need 2 drives if 48k or 64k RAM, only 1 drive + RD if
extra Ram / RD is avaiable (for example: Professionel Copy 1.x
and 2.x, Dos Control, Turbo-DOS Filecopy, the RAF-Commander,
Tight-Filecopy, TOMS Navigator, Spartados' The Browser, Spartados'
The Wedge 2.x, Spartados' Menu, Bewedos' Menu, etc.);
- various 130XE-test programs need 128k RAM, e.g. for bankswitching
tests and/or other things (can be found in many magazines);
- various System-test programs support 48k or 64k as well as extra
RAM; since they were (mostly) written to detect the extra RAM /
Ramdisk, you "should" have more than 48k or 64k memory...
(for example Sytem Info 2.x, System Test 1.x, Memory test, etc.);
- some XE-Sectorcopiers absolutely need a minimum of 128k RAM
(for example: XE-Copier, 130XE-Sectorcopy and many others);
- there are also some Tape programs (Tape-Disk-Copier, Tape-Tape
Copier, Disk-Tape-Copier, etc.) that need a minimum of 128k RAM,
for example VampireSofts 130XE Coolcopy and others;
- there are also some Tape-Ramdisk programs or drivers (which provide
a RD for the Tape users) that need 128k minimum memory;
- no more ideas...

8.13.2 Demo programs:

- Amiga Boink XE by ???, minimum 128k RAM; XE=yes, CS=yes;
- American Natives Demo by FOX-1, needs 256k RAM; XE=no, CS=yes,
AM=yes;
(any RD with min. of 192k should do - just use your own RD driver!)
- Asskicker by Shadows, minimum 128k RAM; XE=yes, CS=yes;
- Anime-4ever by ???, minimum 320k RAM; XE=no, CS=yes;
- Base33 by AIDS, minimum 320k RAM; has a RD-setup menu;

- Bill-Pie-Demo by ???, minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- BMW-Ani by Mirko Sobe, minimum 128k RAM; XE=yes, CS=yes;
- CES-Demos by XANTH (full version) needs 128k RAM; XE=yes, CS=yes;
(the full version includes a) the Robot, b) the Fuji-Boink,
c) the Spaceship, d) the SWAN and e) some scrollers, all in
one file of approx. 580 sectors length; there are of course
separate file versions available that work on non-RD machines);
- Cogito by AIDS, minimum 192k RAM; XE=no, CS=no;
- Comet-Demo by Madteam needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Danielle-Gr.9-Ani by Bill Kendrick has a length of 64kbytes and
therefore should load off of a RD or a Harddisk (a Floppy drive is
verrryy slowww); for a RD-machine 128k total memory is enough;
XE=yes, CS=yes; (any RD should do - use your own RD driver!)
- Edelweiss-Demo by A.R. & CSS needs minimum 320k RAM; XE=no, CS=yes;
(a noisy 256k sample + a picture; the much better intro works
without any extra RAM and is also available as a separate file);
- Ergo-Bibamus by Quasimodos, minimum 128k RAM; XE=yes, CS=yes;
- Glashead/HTPPD by AR+CSS, minimum 320k RAM; XE=no, CS=yes;
- Grafik+Sound-Demo by P.Sabath needs 128k memory; XE=yes, CS=yes;
(many different versions, there is also a 64k version available;)
- Halle 1994B (Wormhole) by AR+CSS, needs 320k?; XE=no, CS=yes;
- (Atari) Hardware-Demo by AR+CSS, needs 320k RAM; XE=no, CS=yes;
- I.B.R.-Demo by MacGyver/AIDS, needs 256k RAM; has a RD-setup menu;
- Igor, Side A by Madteam needs 128k minimum RAM; XE=yes, CS=yes;
- Igor, side B by Madteam needs 192k minimum RAM; XE=no, CS=yes;
- Journey by Polynomials needs minimum 128k RAM; XE=yes, CS=yes;
(uses $05 banks with $36 frames or $0D banks with $96 frames)
- Khai-Et by AIDS needs 320k minimum RAM; XE=no, CS=yes;
- Killer-Whales by Madteam needs 320k minimum RAM; XE=no, CS=yes;
- Lajf-Demo by Madteam needs 128k memory; XE=yes, CS=yes;
- Megablast-Sounddemo by DGS needs 128k memory; XE=yes, CS=yes;
- Muppet-Movie by Madteam probably needs 128k memory?; XE=yes, CS=yes;
- Nascar-Ani by Mirko Sobe needs 128k memory; XE=yes, CS=yes;
- Nonejm by Tight (pre-release) needs 128k memory; XE=yes, CS=yes;
- Owca-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Owca-2 Demo by ??? needs 128k memory; XE=yes, CS=yes;
- Parrot-X-Mas-Demo by A.Ramos needs 128k memory; XE=yes, CS=yes;
- Pedrokko-Parrot-Sounds (10 Disks / 20 Disksides by Pedrokko)
partially need 128k memory; XE=yes, CS=yes; (use your own
RD-driver!)
- Raving Vierpz by Pentagram needs 128k memory; XE=yes, CS=yes;
- Raytracing Animation by K.Pelzer needs 128k memory; XE=yes, CS=yes;
- Raytracing XE by K.Pelzer needs 128k memory; XE=yes, CS=yes;
(also known as "Landscape-XE" Demo or just "Landscape" Demo)
- Raytracing 320k by Elsni needs 320k memory; XE=no, CS=no, AM=yes;
(written in Turbo Basic - patch the listing for your own RD!)
- (1MB) Raytracing-Demo by Solocoder of Ace needs 1088k memory; XE=no,
CS=no, KP=yes; (comes as a Bootdemo on 8 disksides);

- Revenge of Hacker by Rasero Team needs 320k RAM; XE=no, CS=yes;
- Sweet Fantasy by Tight needs 128k memory?; XE=yes, CS=yes;
- Sheol by Bit Busters needs minimum 320k RAM; XE=no, CS=no;
TO=yes, NE=yes, SP=yes;
- Shiny Bubbles by ??? needs 128k memory; XE=yes, CS=yes;
(there is also a shortened 64k RAM version available);
- Stash-Demo by Rasero Team needs 320k minimum RAM; has a RD-setup
menu;
(first use B for manual choice, then again a) for TOMS or c) for any
other type of RD; do not use b) for Compyshop, since it is faulty!)
- Starwars-Demo by AR+CSS needs 320k minimum RAM; XE=no, CS=yes;
(always boot with Option pressed / Basic off, to avoid stripes...);
- Timekeep(er) by New Generation needs 320k RAM?; XE=no, CS=no;
TO=yes, NE=yes, SP=yes;
- Tit-Demo by Madteam needs minimum 256k RAM; has a RD-setup menu;
- Too-Hard-2 by Animkomials needs 128k memory; XE=yes, CS=yes;
- TheTop-3 by WFMH partially needs 128k memory; XE=yes, CS=yes;
- Total Dazed by Tight needs 128k memory; XE=yes, CS=yes;
- Trabant/HTPPD by AR+CSS needs minimum 320k RAM; XE=no, CS=yes;
- Trip6-Demo by Shadows needs 128k memory; XE=yes, CS=yes;
- Ultra by Taquart needs 128k memory; XE=yes, CS=yes;
- Ultra-2 preview by Taquart (unfinished, very buggy and much too
short!) requires 128k memory for whatever reason...;
- Vengeance by Excellent needs 128k memory; XE=yes, CS=yes;
- Vent by Exc.+Pent. needs 128k memory; XE=yes, CS=yes;
- Video Blitz by Helvetica Bold needs 128k memory; XE=yes, CS=no;
(Antic must have RD access, otherwise the Demo doesn`t work!);
- WAF-Demo, Side B by WAF members, two parts need 128k memory
(Raytracing Part and Vector Part); XE=yes, CS=yes;
- Worms-Demo by Datri needs 320k minimum RAM; XE=no, CS=no;
(on a XE or CS-RD you can see the ani with many bugs);
- X-Demo by Madteam needs 320k minimum RAM; has a RD-setup menu;
- X-Files Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by ??? needs 128k memory; XE=yes, CS=yes;
- XE-Demo by SAG needs 128k memory; XE=yes, CS=yes;
- Xyberscape-XE by Bill LeMasurier/TAF needs 128k memory; XE=yes,
CS=yes;
(there is also a 64k version available separately);
- Zero-Demo by New Generation needs 128k memory; XE=yes, CS=yes;

8.13.3 from the ABBUC PD library catalogue:
(still active, still growing!)

- PD 52: Der Neffe (engl.: The Nephew), a german text+graphic adventure
requires 128kbytes minimum memory (a 64k version also exists
somewhere);
- PD 85: Rechnen fuer Kinder (engl.: Calculations for Children)
requires
128kbytes minimum memory (includes help-guidelines -in german?-);

- PD 86: Diskettenverwaltung 130XE (Disk-Database 130XE) requires 128k
minimum memory (has room for up to 1872 datafiles);
- PD 113: Hires Dump (a print program for Hi-Res. Graphics) requires
128k
memory and prints 8 Design-Master pictures (Gr. 8) on one A4 page;
- PD 121: Der Zeitungsredakteur (engl.: The Newspaper-Editor) requires
128k minimum memory; includes a Printshop Converter, a Hardcopy &
more;
- PD 150: 130XE Impossible Demo (from Belgium), shows a rotating and
bouncing ball, many gfx-effects, a scroller and more, all on one
screen!;
- PD 185: Kemna Video (creates Intros for Video-Films) requires
128kbytes
minimum memory; needs Turbo-Basic XL;
- PD 191: Auto-Show 130XE (Car-Show 130XE) shows 8 pictures of old cars
("Oldtimers"), requires 128k because the pictures run off of a RD;
simply change the viewer for 48k/64k Ataris;
- PD 192: 130XE Demo (from SAG, Netherlands) requires 128kbytes memory;
simple Turbo-Basic effects; change the listings (all entries with D8:
into D1:) to run the demo on a non-expanded 48k or 64k Atari;
- PD 209: Raytracing Animation by Karl Pelzer requires 128k minimum
memory and shows 3 different raytracing animations;
- PD 297: Macro-Assembler 4.32 by Thorsten Karwoth requires 128k
minimum
memory and includes also a ML-packer; german docs included;
- PD 303: The Small Printery by Walter Lojek requires 128k minimum
memory;
(also supports bigger Ramdisks of up to 1024kbytes), this is a
printer
program for newspaper-like pages or graphics; prints six Gr.8
graphics
a) on one A4 size page or b) on two A5 size double pages;
- PD 333: Hobby-Tronic-High-Resolution-Power-Pack-Demo (HTPPD) by
A.R. & CSS requires 320kbytes memory (and a Compyshop compatible RD);
this double-pack includes the "Glasshead" and "Trabant" Demo;
- PD 337: Landscape-XE Demo by Karl Pelzer requires 128k minimum
memory;
shows a nice raytracing animation with glassbowls in 256 colors;
- PD 349: Fraktale/Colorprint (Fractals & Colorprint) by Peter Woetzel
requires 128k minimum memory; both programs include
window-techniques;
- PD 356: Edelweiss-Demo by Analog Research & Chip Special Service
requires 320kbytes memory (and a Compyshop-compatible Ramdisk!);
- PD 357: Hardware-Demo by A.R. & CSS requires 320kbytes memory
(and a Compyshop-compatible Ramdisk !);
- PD 361: Gizmo`s Castle by Black Panther requires 128k minimum memory
(a 64k version is available as PD 385);
_ PD 368 130XE+ Macro-ASSembler 2.2 by Thorsten Karwoth requires 128k
or more memory (works under MyDOS only, supports up to 1 Megabyte
RD);

note that 2.2 is the newer version and 4.32 (PD297) the older one !!
- PD 383: Rund um die Ramdisk (Subject: the Ramdisk) includes many
docs & manuals as well as drivers for creating an Atari 800 and/or
some Atari XL ramdisks (800=D.Byrd, XL=Peterson); the drivers and
testprograms require a certain amount of extra RAM; (e.g. the 576k
tester requires 512kbytes extra Ram, etc.);
- PD 387: Draw XE a Gr. 15 painter program (Shareware) requires 128k
minimum memory; english docs are included;
- PD 396: 1MB Raytracing Demo by Solocoder of A.C.E. requires a 1MB
Ramdisk, type Megaram 3 from Klaus Peters; the demo consists of 8
Bootdisks and does not work (yet) with any other Ramdisk;
- PD 401: Video Blitz XE by Helvetica Bold requires 128k memory and
Antic access !! (will not work on any RD without Antic access);
- PD 466: Kassettencopy (Cass.Copy) by Joerg Gernreich; copies Tapes
to Diskette, one of the three programs (Copy64) needs 128k memory;
- PD 480: Dream Vision, a sort of "universal" IFF viewer from Poland
requires 256kbytes memory (CS,PE,RA,BU,AM,etc.); shows IFF pics
in Gr. 9 resolution on a virtual screen; scrolls in any direction;
- PD 525: Igor-Demo by MadTeam; Side A requires 128k memory, side B
requires 192k memory (and the whole Demo can be viewed with a 320k
machine); works via separate Batchfiles for each configuration;
- PD 526: Extract Slideshow by Replay/Bit Busters requires 128k memory;
shows many fantasy pictures with different fade-in/fade-out effects;
- PD 527: Total Daze by Tight requires 128k memory;
- PD 528: Trip 6 by Shadows requires 128k memory;
- PD 550: Xyberscape XE by Bill Le Masurier / TAF requires 128k memory
(a 64k version can be found on the backside of the disk!)
- PD 564: American Natives by Fox-1 requires 256k minimum memory (any
Ramdisk should do, just use your favorite DOS and RD driver) and
Turbo-Basic-XL (or was it compiled TB?);
- PD 611: Zargon, a german textadventure by Mapda requires 128k memory;
- thats it so far (the ABBUC PD library is still growing!);

8.13.4 from the HAPS PD library catalogue:
(still active & still growing!)

- PD0013: 130XE Artshow requires 128k memory; here 15 Koala pics load
off of the RD, simply change the viewer for 48k or 64k machines;
- PD0015: Hi-Res Designer a gr.8 drawing program requires 128k memory;
- PD0031: Utilities (10 test programs for 130XE) require 128k memory;
- PD0109: Monitor, Debugger and more; the brief catalogue text says
that the Basic Wedge 2.85 requires a 130XE, however the full docs of
the Basic Wedge tell that it was written on a 130XE and requires
(only) RAM under the OS ROM (the Basic Wedge expands Atari Basic);
- PD0294: Newspaper-Editor (english version of "Der digitale
Redakteur")
requires 128k memory;
- PD0296: Grafik-Zeilen-Editor (Graphic-Line-Editor) a program to
create

and print disk (and other) labels, requires 128k memory;
- PD0302: Strategy Baseball, a Baseball program for 130XE computers,
requires 128k memory (english docs included);
- PD0303: The Works a layout program by Tom Hunt requires 128k memory;
- PD0308: Multi-Tasking-OS a shareware demo by Tom Hunt requires 128k
memory; also includes a demo for 256k memory machines;
- PD0341: XE Impossible Demo from Belgium requires 128k memory;
- PD0350: CAD XE, a computer-aided-design package requires 128k memory;
- PD0351: R-Draw 1.3, a hi-res drawing program requires 128k memory;
- PD0434: Programmverwaltung 130XE (Database 130XE) requires 128k
memory;
- PD0437: Textpro 4.5 / 130XE requires 128k memory; there is also the
Atari 800/XL version for 48k or 64k machines available;
- PD0485: Zargon a german textadventure requires 128k memory;
- PD0486: Atari 130XE Demo naturally requires 128k memory;
- PD0514: The Small Printery by Walter Lojek requires 128k memory;
- PD0597: Atari Hardware Demo by A.R. & C.S.S. requires 320k memory
(and Compyshop compatible Ramdisks);
- PD0598: The Starwars Demo by A.R. & C.S.S. requires 320k memory
(and Compyshop compatible Ramdisks);
- PD0617: The Turtles Demo by Ultra Software requires? 128k? memory;
(the file version by John E. of TBSF does, maybe this bootdisk also?)
- PD0637: Autoshow 130XE (Oldtimers) requires 128k memory; simply
change the pictureviewer for 48k or 64k Atari machines;
- PD0789: Cyberscape XE by Bill LeMasurier requires 128k memory
(there is also a 64k version available separately);
- PD0909: Super Print Lab XE (demo version) requires 128k memory;
- PD0936-PD0945: Pedrokko Sound Demos (10 disks/20 disksides) partially
require 128k memory (some long digi-sounds need more than 64k RAM);
- PD1050: Die Wuertemberger Disk (from ABBUC regional group WAF)
contains the XE version of Gizmo`s Castle which requires 128k memory
(there is also a 64k version avaiable from ABBUC);
- PD1084: Rund um die Ramdisk (Subject: the Ramdisk) contains
schematics and other things to build various ramdisks; the test
programs need a certain amount of extra memory (i.e. the 576k tester
needs 512k extra memory);
- think, that`s it for now...

Note: - XE means 130XE Ramdisk (size: 64k);
- CS means Compyshop Megaram 1 or 2 (size: 256k);
(schematics available from ABBUC)
- AM means Atari Magazin Ramdisk (size: 256k);
(schematics can be found in AM 2/1987)
- KP means Klaus Peters Megaram 3 (size: 1024k);
(schematics available from ABBUC)
- TO means TOMS Ramdisk (size 256k-1024k), this is
standard in Poland [and compatible to Newell];
- NE means Newell Ramdisk (size 192k-4096k),
distributed by Newell Ind. and patched by users;

- RA means Rambo XL Ramdisk (size: 192k),
distributed by ICD and selfmade by users;
- SP means Scott Peterson Ramdisk (size 192-1024k),
where the 1MB version is Newell compatible;
- has a RD-SETUP menu means, that you have to hold
down SHIFT upon bootup to get the setup-menu; here
it should be possible to setup any XE-compatible RD;
- I could only test XE and CS Ramdisks, since
I do not have any other kind of RD;

Thats all so far. Any additions or corrections are welcome.
Greetings, Andreas Magenheimer.

EoE or EoF.

2838. additional Ramdisk info...

Hello Folks,
here is an additional Ramdisk info text, that could be of interest to
some of you - especially those that have a Newell or Peterson Ramdisk...
-andreas.

** Peterson XE Upgrade Errata **
(Getting the ANTIC to see your extra ram.)

by Ed Bachman 1990.

==========

** Should I be reading this?? **

If you are using a stock 130XE or a Rambo'ed 800XL you have no
need to read any further, (other than for informational purposes).
Also, CSS modified XE's are built in accordance with the modification
listed below. This text concerns you if you are using an XE of
greater than 128k, OR (more specifically), if the Wedge's FORMAT
command results in an apparent system crash.

Onward..

In the process of developing the current revision of the Wedge, I
stumbled across an interesting bit of information. It seems that the
320k Peterson XE upgrades don't allow for the ANTIC chip to access
extended ram. Anyone familiar with this upgrade knows that the antic
enable pin of the PIA chip gets lifted from the motherboard to
provide for the extended addressing needed to access the extra ram.
Thus leaving the ANTIC's extended bank addressing capability
untapped. This can be overcome by tying the antic and cpu's enable
lines together (much the same way as it's done in the rambo'ed XL's).
Correcting this is simplicity itself, simply tie pins 14 and 15 of
the socket for the PIA, together, (you know, that socket that you
hopefully installed when you did your upgrade?), If not, simply run a
short jumper from the pad on the motherboard that pin 15 used to
occupy, to pin 14 on the same chip, (the PIA).

NOTE: From the docs I've seen, the larger Peterson XE upgrades
look
as if they also neglect the antic enable line. This minor mod should
work just as well on them as it has on the 320k XE's.

** So what does this mean to me? **

Well hopefully you're reading this before you've run the wedge
and found out that the format command bombs out in a major way. Why?
because the format command uses a custom screen and display list, run
out of the extended ram. Thus ANTIC, being unable to access extended
ram will attempt to generate a screen from whatever data is in the
main bank at those particular locations. The resultant display will
usually be a blank screen, or some unreadable garbage. To address
this, I've included a specially written format program,
"P_FORMAT.COM". In order to demonstrate the format function to those
whose machines are unable to use the Wedge's internal format command.
AND, to hopefully coerce you to perform this simple mod to your XE.

I realize, it is not normally the place of the software developer
to tell users, "well, just modify your machine to use my software".
However I feel most strongly, that this feature will enhance the use
of your expanded XE, as well as make it compatible with future
programs that may use the extended antic access. As well as with the
Wedge and future Wedge Disk Accessories.

In closing I wish to thank Scott Peterson for his series of XE
upgrades and in no way intend for this text to berate his fine work
on the Atari 8-bit.
Ed Bachman 1-3-90.

EoE or EoF.

Hello Folks,
yet another ramdisk info text, for those that are interested or for the
collectors. -Andreas.

NEWELL 256k to RAMBO XL Switch
By Craig Goranson
Version 1.0 October 17,1990
Version 1.1 May 7,1991

This is instructions on how to install a switch, with some
hardware, to give your Newell Industries memory expansion board
100% RAMBO XL compatibility.

I. Why I built it. (this is just some background)

When I decided to upgrade my 800XL to 256k I chose the Newell
Industries upgrade. It is a very well thought out upgrade and I
have been happy with it and its performance. Unfortunately the
Newell upgrade and the popular Rambo XL/CLaus Bucholz upgrades
are incompatible. They use different bank selection technics and
locations that means software written for the Rambo XL will not
run on the Newell upgrade. The two main differences between the
upgrades is the fact that the Newell does not allow you to bank
select the main memory while the Rambo does, and the fact that
they went with different memory maps of the banks. Because of this
I could not run such fine programs as SNAPSHOT and MTOS3. There
has been a modification out for some time that added a switch that
rectified the bank switching incompatibilities so the Newell could
use the same bank select sequence as the rambo XL, but it did not
fix the problem that the Newell does not allow you to select the
main banks. So I decided to sit down and fix it so the Newell
could be switched to 100% Rambo compatible mode. The next section
is how the upgrade works. You can skip it if you just want to get
down to the nitty gritty.

II. How it works

The problem arises with how the two upgrades handles bits 5
and 6 of PORTB. Bits 5 & 6 can equal from 0 to 3 and select one of
the 4, 64k segments of the 256k chips. Bits 2 & 3 of PORTB then
select 1 of the 4, 16k banks of the 64K subdivision.
(4*16k=64K,64K*4=256k) The following is a table of the values for
bits 5 & 6 on the Newell and Rambo boards and which 64k bank they
select.

```
|----------------------------------------|
|B|B| Newell Board | Rambo Board |
|5|6| 64k bank | 64k bank |
|-|-|------------------|-----------------|
|0|0| enhanced bank | main 64k bank |
* |1|0| protected | enhanced bank |
|0|1| enhanced bank | enhanced bank |
* |1|1| enhanced bank | enhanced bank |
|----------------------------------------|
```

In the above table you will notice the "protected" bank in the Newell table. This is the number that would select the main banks of memory if they were not blocked out. Instead of the Newell switching in the main banks of memory it just switches in the same banks as if bits 5 & 6 were both 1's. If you ran a program that expected to be using a machine with a RamboXL upgrade, it will seem to work but the mirror effect of the one bank being switched in as two different banks will destroy data. (The RD.COM file from Sparta Dos takes advantage of this fact to tell if you have a RAMBO or not.)

A simple fix to this problem is to invert the BIT 5 before it reaches the Newell board. This is the fix that was given to us by Wess Newell. This fixes the mirror bank problem, and RD.COM and other software will run, the bit inversion juggles the banks so they are in the right place. But the Newell upgrade still protects the main bank of memory. SO software written for the Rambo that needs to access the main banks through the $4000-$8000 window still will not work. (Major Crash!!)

My solution is fairly simple to build it you are good will a soldering iron and are fairly patient. What my modification basically does is invert bit 5, bypass a NOR gate, and invert a bit that was going through the NOR gate. It to lengthy to explain the nitty gritty so I will leave it up to you to figure it out if you really want to. You don't need to understand how it works to install it, the main thing is that it works. Anyway after this modification is installed you will have a switch to change between 100% Rambo mode and 100% Newell mode. The best of both worlds.

III. Building the Newell/RAMBO switch

Parts list.
1 74ls14 inverter (or 7414,7404,74ls04, doesn't matter.)
1 DPDT switch for mounting on case
a fairly good amount of wire

You will also need a soldering iron, solder, a small awl or screw driver to pry up a pin, and a steady hand. (and prayer if you are religious.) And a desoldering device such as a suction device or de-soldering braid.

Assembling it:

1. remove the top, and shielding from you computer to you
are looking down at the Newell board. (I hope you know how to do
that.)
2. Locate the 7402 or 74ls02 chip on you Newell Board. It
should be on the left side, second from the bottom. It is
labeled U5 on my board.
3. Locate pin 1 of the U5 chip and desolder it.
4. Carefully bend up pin one and clip it off leaving enough
room to solder a wire on to it.
5. Clean up the solder pad that pin one was pried out of,
then solder one end of a wire to it.
6. Orient the DPDT switch so you are looking at the back of
it. I will refer to the pins by the letters as follows in the
diagram below. The "*" sign designates a pin on the back of the
switch.

a* d*

b* e*

c* f*

7. Solder the other end of the wire, that is attached to the
solder pad, to pin "b" of the switch.
8. Now desolder the wire that goes from the Newell board to
pin 15 of the PIA chip, from the PIA. (the pia chip is labeled U23 on
the
computer board) Then attach the end of the wire to pin "e" of the
switch. (This allows the re-routing of the BIT 5 of PORTB)
9. Now solder a wire from pin 1 of the U5 chip to pin "a" of
the switch. (pin one is the one you bent up earlier.)
10. Now get you 74ls14 (or equivalent) and trim all the pins
except 3,8,16. Leaving enough room to tack solder wires on to the
trimmed pins.
11. Next solder a wire from pin 4 of the 74ls14 to pin "c"
of the switch.
12. Solder a wire from pin 1 of the 74ls14 to pin"d" of the
switch
13. Now carefully place the 74ls14 chip over U5 (74ls02) on
your newell board. Then solder pins 3,8,16 to the corresponding
pins on U5. The chip should piggy back nicely on the U5 chip and
the only pins of the 74ls14 chip that should touch pins on the
74ls02(U5) is 3,8,16.
14. Desolder the wires (from the pia) that go from the
Newell upgrade board to pins 12 & 13 of the PIA chip. Then solder
the wire that went to pin 12 to pin 13. And solder the wire that
went to pin 13 to pin 12. (you are just swapping the wires to put
the banks in the right order)
15. Last but not least solder a wire from pin 15 of the PIA
to pin"d" on the switch. (there should now be two connections on
pin "d" of the switch)
16. Congrats!!! You made it.

You now have a switch that can be mounted were you want, that gives you full RamboXL compatibility at a flip of the switch and allows you to switch back to Newell mode. I also recommend that you install the switch described in you newell instalation manual that allows the Antic chip to follow bank selecting. This will give full compatibility with about every program. Any input is welcome, as I can be reached on by BBS or genie. This is the first revision of this modifications so I would appreciate any notifications of errors in this document. (except grammar and spelling)

Revisions:
v. 1.0 The document as I originally wrote in back when I made the modifications to my computer.
v. 1.1 revised on may 6, 1991. I had left out step #14 in which you swap the wires going to pins 12 & 13.

- Craig Goranson -

2840. additional ramdisk info (part 3)

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-17 17:45:25 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CE541B5.FECD0817@students.uni-mainz.de>
Source record: 29411

Hello folks,
finally here is the last part of all my ramdisk info texts. boring for
most Atarians, helpful for those that are interested. -Andreas.

RAM[disk] Control On An XL/XE Computer - by John K. Picken
(this is a shortened version, the cartridge info has been cut off)

[snip]
Let's first look at what you've got to play with as far as extra
RAM, how it's done, and what kind of problems you can run into: No
matter how much memory is installed in your computer, the 6502 can
never access an address outside the range 0-65535 (64k). With BASIC
off, this limits normal RAM to 48k as the Operating System (OS) and
hardware chips take up the last 16k. With BASIC on, or a cartridge
installed, you lose yet another 8k.

Software like SpartaDOS and Turbo BASIC utilize another 14k of RAM
by deselecting the OS. As far as I know, nobody ever produced 6,
14, or 62k chips so there has to be another 2k of RAM in there.
But, unfortunately, the only way you can deselect the hardware
registers is with the power switch.

Since the 6502 can't "see" extra memory, you have to trick the
computer into believing it's not seeing what it is, which is how
all software that uses extra RAM works. It operates by "bank
switching", a concept more understandable with a memory map so
here's a rough picture of the 64k address range in your computer
broken up into four 16k "banks":

```
IMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM;
: Bank Address Range :
: Num. Dec Hex Usage :
GDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDD
D
: 0 00000 to $0000 to RAM for OS, DOS, :
: 16383 $3FFF and user programs. :
GDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDD
D
: 1 16384 to $4000 to User RAM. Some ROM :
: 32767 $7FFF if selftest enabled. :
GDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDD
D
: 2 32768 to $8000 to User RAM, screen RAM. Top half is :
: 49151 $BFFF ROM if BASIC on or cartridge used. :
```

```
GDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDDD
D
: 3 49152 to $C000 to OS ROM and i/o chips. :
: 65535 $FFFF User RAM if os off :
HMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM<
```

Usage indicates the only bank which is almost always all RAM and can safely be switched in or out is number 1, which is exactly how the 130XE is designed. Its extra RAM is divided into four 16k banks, each of which can replace normal memory in bank 1. In effect, the 130 memory map looks like this:

```
Main Extended Memory
IMMMM;
: m0 :
LMMMMNMMMMQMMMMQMMMMQMMMM;
: m1 : x0 3 x1 3 x2 3 x3 :
LMMMMNMMMMOMMMMOMMMMOMMMM<
: m2 :
GDDDD
: m3 :
HMMMM<
```

Compatible memory upgrades are mapped in the same way. The only difference is that there are more extended banks - up to 64 with 1 meg. Each bank when switched in, appears to the computer as main bank 1. The diagram is slightly misleading in that it implies the extra banks sort of slide into place one after anotherDDthey don't. Any one can be selected in any order you wish.

Switching RAMs and ROMs is physically simple. Almost all control is handled by a single hardware address known as PORTB (54017 or $D301). The bits in PORTB have the following functions on a 130XE:

```
IMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM;
: Bit # 7 6 5 4 3 2 1 0 :
: ZDDDBDDDBDDDBDDDBDDDBDDDBDDDBDDD? :
: Usage 3 t 3 y 3 x 3 e 3 j 3 i 3 b 3 o 3 :
: @DDDADDDADDDADDDADDDADDDADDDADDDY :
: Hex. $80 40 20 10 08 04 02 01 :
: Dec. 128 64 32 16 8 4 2 1 :
HMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMMM<
```

Bit 0 (o) if high enables the OS ROM

Bit 0 is used by Sparta and Turbo to toggle between RAM and ROM to make use of that hidden 14k. This requires a juggling act since the OS interrupt handlers are in ROM and must be re-enabled, 60 times per second, to avoid a crash, or else the program must provide its own interrupt handlers. Additionally, since Antic updates the screen before the 6502 gets to process the interrupt, it is necessary to use an alternate character set in lower memory or to

copy the ROM one into RAM at the same address.

Bit 1 (b) if low enables the BASIC ROM

To figure values in PORTB you add the decimal values under each bit to be set to 1. Since, with all bits set, the total is 255, it's often simpler to subtract. PEEK (54017) in BASIC will produce 253 meaning everything's high except bit 1. The same PEEK with Turbo gives 255 as the BASIC ROM is off. This is the only bit you normally see change.

Bit 7 (t) if low enables Self Test ROM

As with RAM, there has to be 2k of ROM left over. There is, and it's used for part of the Self Test routines. When bit 7 is low, it's enabled. Since hardware registers can't be deselected, this portion of ROM deselects and replaces RAM from $5000-$57FF in bank 1. Unless you're really into listening to simple music, a really slow and incomplete RAM test, or watching keys flash on an image of a 1200XL keyboard, you can consider this 2k of ROM to be free space if designing an OS upgrade.

Bit 4 (e) if low enables extra RAM

Bit 4 is the master switch for extra memory. No matter what values are in the other bits, the 6502 will always use normal memory when this bit is high.

Bits 3 and 2 (ji) select one of four 16k banks

These bits together determine which one of the four 16k banks is enabled. They simply count from 0 to 3 in binary where, if j is set you add 2, and if i is set you add 1:
j i bank
0 0 00
0 1 01
1 0 02
1 1 03

Here's what the memory map would look like with bits 3 and 4 low (remember the 6502 only "sees" the RAM in the "Main" column):

Main Extended Memory
IMMMM;
: m0 :
LMMMMNMMMMQMMMMQMMMMQMMMM;
: x1 : x0 3 x1 3 x2 3 x3 :
LMMMMNMMMMOMMMMOMMMMOMMMM<
: m2 : Note: main bank 1 doesn't move
GDDDD anywhere, it just disappears
: m3 : until you deselect extra RAM.
HMMMM<

Bit 5 (x) enables Antic access

On a 130XE, each of the four extra banks can be assigned individually to either Antic or the 6502 or to both, a setup that is rarely usedDDforget about them if you only have a 130. On the 130 these bits are normally set to one.

Bit 6 (y) does nothing

BEYOND THE 130

Once you exceed 64k extra RAM you need more bits so the upgrade designers took the bits that I just told 130 owners to forget about. Bits 6 and 5 (yx) select one of four 64k blocks. These work similarly to 2 and 3 except that you use them to select one of up to four 64k blocks and within each of these, you use bits 2 and 3 to select one of the four 16k banks (just as for the 130). Because the 130 normally keeps these bits high, their sense is reversed from that of 2 and 3. Don't worry about the difference, all you need to know is which values work for your upgrade. The following bit patterns work for 256XL upgrades:

y x 64k Block Available On
1 1 00 (130XE) All
1 0 01 All
0 1 02 Bucholz/Peterson/Rambo
0 0 03 Newell

256XL PROBLEMS

With a Bucholz/Peterson/Rambo 256XL you can run into a significant problem enabling the third extra block. If your software is set up for a Newell, not only will you not be able to use the third block, but any attempt to do so results in various other main banks showing up as main bank 01. What you end up with is a mapping like the following which results from attempting to access extended bank x08 using Newell bit patterns:

Main
IMMM; DDDDDDDDDDDDDDBD 64k blocksDDDBDDDDDDDDDDDDDD?
:m00: 00 3 01 3 02 3
LMMMNMMMQMMMQMMMQMMMKMMMQMMMQMMMQMMMKMMMQMMMQMMMQMMM;
:m00:x003x013x023x03:x043x053x063x07:x083x093x0A3x0B:
LMMMNMMMOMMMOMMMOMMMJMMMOMMMOMMMOMMMJMMMOMMMOMMMOMMM<
:m02: Extended RAM Banks (hex)
GDDD
:m03:
HMMM<

Obviously, this is a prelude to disaster as trying to write to bank x08 will overwrite DOS or the OS low RAM storage. Similarly, attempting to write to bank B could write to the hardware chips. With the Newell upgrade, wrong bit patterns enable Antic access to the extra RAM which should be harmless as the display list and screen RAM are rarely in this address range. It still however, restricts extra RAM usage to 128k.

So if you're having RAMdisk problems with a 256XL, odds are you're using the wrong software. ICD put out separate versions of their RD handler to address this and you need to obtain the correct one. With MYDOS you won't have a problem if you use the default RD configuration (menu item "O") but if you select a custom sequence or enter one manually, you must be aware of which banks are available.

UP TO A MEG

If you've been keeping count, you can see there's no more bits available in PORTB. To get past 256k, the designers decided to take over the BASIC bit, and to go to a meg, the Self Test bit.

b if 0 enables the second 256k
t if 0 enables the second 512k

If both of these are high, you're in the first 256k. If bit 7 is low and bit 1 high, you're in first half of the second 512k (third 256k), etc.

BEFORE YOU UPGRADE

You might run into a problem with bit 07 if you have installed a custom operating system chip: It may be used, by the chip, for other purposes such as switching in its own RAMdisk or display handler. Check this out before investing in an upgrade past 576K. Also, there are some XE's on which the 1-meg upgrade does not work. I have not experienced this personally but have read message traffic about it which implicates the model of the Antic chip installed. If you're unsure, ask questions first.

ACCESSING THE BANKS

Rather than figure bit patterns, it's a lot simpler to use a table. The one following gives the access value for every possible bank up to 1 megabyte. The values are with the OS on and BASIC (if present) off. They are given in hex and are exactly the values needed to set up a MYDOS RAMdisk for the banks you have and wish to assign to the RD.

RAM BANK ACCESS TABLE 64-1024K

PORTB Available on Type

E3,E7,EB,EF 1,2,3,4,5,6,7,8,9
C3,C7,CB,CF 2,3,4,5,6,7,8,9
A3,A7,AB,AF 2, 4,5,6,7
83,87,8B,8F 3,4,5,6,7
E1,E5,E9,ED 5,6,7
C1,C5,C9,CD 5,6,7
A1,A5,A9,AD 5,6,7,8
81,85,89,8D 5,6,7,8
63,67,6B,6F 6,7
43,47,4B,4F 6,7

23,27,2B,2F 6,7
03,07,0B,0F 6,7
61,65,69,6D 7
41,45,49,4D 7
21,25,29,2D 7
01,05,09,0D 7

Type Upgrade Mapping
1 = 130 XE
2 = 256 XL Bucholz/Peterson/Rambo
3 = 256 XL Newell
4 = 320 XE Peterson
5 = 576 XE "
6 = 832 XE "
7 = 1088 XE "
8 = 832k+ " (BASIC on)
9 = 576 XE " " "

Note 1: The documentation by Scott Peterson on his upgrades indicates that only 128k is available in XE-compatible mode (Types 8/9 above). Two more 64k blocks are available as indicated with 832 or 1088k machines though not all RD handlers will find and use them.

Note 2: Based on an article by Jeff McWilliams in the April 1993 edition of AC, it appears the Newell 1-meg upgrade is mapped similarly to the Peterson.

Note 3: With version 2.1 of the SpartaDOS Wedge, Ed Bachman describes a simple fix for Peterson upgrades to reenable Antic access to extended RAM. It is definitely worth checking out, even if you don't use SpartaDOS.

MAJOR RAM - MAJOR GLITCH

Taking the BASIC bit caused a serious problem which has not been well documented. I found it the hard way: trash and crash. When the computer boots, the OS does not test to see if BASIC exists and is available; it simply assumes it is. The result is that even though pointers for the screen and so on are correctly set, bit 1 in PORTB is set or cleared based solely on the Option key. The BASIC flag is similarly set so that PORTB is restored to the booted value on Reset.

With a 512k+ upgrade this means the instant you enable extra RAM by dropping bit 4 in PORTB, you're in the second 256k instead of the first. If you use your extra memory only as a RAMdisk this mixup might not cause a problem depending on the handler code. But unless it's fixed, before using any other program which accesses extra RAM, 99% of them will trash your RD if they don't completely crash the computer.

FIXING IT

You can't just correct PORTB since Reset restores it. You have to get a non-zero value into BASICF (1016 or $03F8). The problem is compounded under SpartaDOS which maintains an eight-byte stack of PORTB values for exit from various internal routines. One solution is to hold Option every time you boot. Under SpartaDOS with no cartridge, a BASIC OFF followed by a Reset should fix it. With a cartridge stuff a non-zero value into BASICF and press Reset.

I always build in a test routine to programs which are going to manipulate RAM or ROM to ensure that BASICF and PORTB are correctly set if BASIC is off or absent. In addition, I search for and correct the stack in Sparta. BobTerm 1.22 corrects the Sparta stack for version 3.2d or f but, as it uses absolute addressing, this might lead to problems with different Sparta versions. So, if you have a problem with BobTerm and Sparta, the answer might be to switch to version 3.2d/f.

The way I find the stack in Sparta is to look for a LDA PORTB instruction, followed by a STA ADDRESS,X where ADDRESS will be the address of the stack. With version 3.2+ you should find it on page 7; with version 2.3 it's on page 9. Once found, it's a simple matter to set bit 1 in each of the eight values correctly.

2842. Emulated Berserker Works Computer Games by Saberhagen?

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-18 02:15:48 UTC
From: uniace3@aol.com
Message-ID: <22a85251.0205171815.4a669a85@posting.google.com>
Source record: 29414
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic,alt.folklore.computers,alt.folklore.computer,rec.arts.sf.fandom

Hello,

I am trying very hard to find emulated versions of some very rare out-of-print software. I am looking for games released by Joan & Fred Saberhagen's company: Berserker Works Ltd. The games were made and sold between 1982 and 1989. They were designed for home computers popular at the time, i.e. Apple II series 48k, Macintosh 512k, Commodore 64, Atari 400/800, IBM-PC, IBM-PC jr. Several of the games were based on Fred's popular scifi books about the Berserkers (giant robotic space fortresses from a long forgotten war whose mission is to destroy all life in the galaxy). I am trying to find emulated copies of these games, ESPECIALLY Apple II versions, so that they can be included on a CD full of historical software which will accompany an upcoming book entitled the "New Media Reader." Nick Montfort is putting together this book and CD for the MIT Press about electronic and other non-traditional forms of literature. I also hope to find these games for display on an official Berserker fan web site I am making. I am operating with cooperation/authorization of the Saberhagens, who hold the rights to these games. Here is the list of all the games I am looking for emulated copies of:

BERSERKER RAIDS
WINGS OUT OF SHADOW
WIZARD WAR
PRIDE AND PREJUDICE

I am especially interested in finding the first two, and again especially interested in finding Apple II versions (as that is the only emulator which they currently plan on including with the CD).

A few of you out there have already helped me and I thank you. I am stepping up my efforts to find working emualted copies of these games.

Also, I've had little experience tinkering with emulated games and the various emulators to get them to work. If anyone is willing to help me, or could point me toward any helpful resources, that would be most appreciated.

Please respond here in this thread, or email me at jfinleyNOSPAM@ucla.edu (minus the NOSPAM) or both! Thank you very very much for helping,

Jason Finley

Andreas, you're missing some info on the Mini-RAMdisk Bill Wilkinson wrote
for COMPUTE! in his October 1986 Insight: Atari column, for those XL/XE
computers not lucky enough to have more than 64KB. It used the 14K under
ROM space to provide a small RAMdisk.

Wouldn't that be with a FAT32 file system or does that matter?

Hi everybody,
is there a way to create tapes (wave files to record to a tape) from Atari 8
bit emulation files, in order to use them with an original Atari 800/XE?

I don't have a disk drive for the Atari XE.

Thank you in advance for the answer

Davide Guida

I thought the minimum allocation size for an IBM file was something like 32k
now. That is, 3 separate 4k-8k games will take up 96k of disk space.

2849. Looking for manual for SSI Broadsides

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-18 13:14:51 UTC
From: mcurrent@carleton.edu
Message-ID: <ueckubnbtkkacf@news.supernews.com>

Seeing as how this upgrade was the first on the market, there wasn't any
of the above to be compatible with.

> *** Russ Gilbert mentioned that his Newell RD uses 83,87,8B,8F
> as main Ram and A,C,E as extra Rambanks - thus it is compatible
> to Peterson, Buchholz and Rambo XL. Looks like Wes Newell changed
> the design of his Newell Ramdisks from time to time. However,

In an effort to try and maintain some sort of standard, I changed the
design to be compatible with the Rambo XL some time after it came out. I
also offered instructions to change the original ones to be compatible.
required some simple trace cuts and jumpers. No additional parts.

> most 192k (256k total) Newell Ramdisks are not compatible to the
> above (at least all my docs, manuals and e-mails say so). But

> built in Atari Basic: YES!, XL/XE Selftest: YES!, Antic access: no!

Antic Access? The Newell upgrade was the only one that handled the Antic
chip properly. Don't beleive me? Run the demos that came with Basic XE
using the upgrades. The Newell upgrade is the only one that ran them
properly. Look at the upgrades. Count the chips. The extra ones on the
Newell upgrade are for Antic support.

> > Has anyone ever tried this (developed hardware/software to make this
> work) ? <

When you have an Atari XF551 you can connect such a drive to the XF PCB without too much troubles to use it as 40 tracks double-sided drive. When using a patched EPROM you can go up to 80 tracks double-sided (that is 720KB on one floppy, be it 5,25" or 3,5").

The HDI interface is developed in Germany and is s PCB you connect to the Atari SIO-port. You can attach up to 4 standard (PC/Amiga/ST-like) mechanics to it, up to 1,44MB. As a bonus it supports percom blocks compatible with the Happy 7.10 upgrade for the 1050 drive.

One disadvantage: it is no longer produced, mainly due the non-availability of an important IC used in it...

I *think* FAT32 only uses 4k as a minimum file size/allocation unit. I'm pretty sure you only get into huge allocation units with more modern versions of Windows with big drives.

My W2000 Pro system is down or I would cross check. It's just a right click on a small file and scroll down to properties.

Hello Andreas,

Don't worry, I'm not dead yet. There is a saying, I don't remember how it goes but It says something like their is nothing surer than Death & Taxes. In my case, I added Moving, because no matter how hard I tried to stay with my old Internet Service Provider, it wouldn't work. This after I spent over 360 Dollars over 2 Months Calling a Long Distance number that was still compatible with my Atari. Over that 2 Months I was trying to Get Cab and get it set up so I could still use my old ISP. I was about to get CAB up and working so I could call Pacifier locally again, but then Pacifier finally told me about a Protocol that My Atari and CAB doesn't support. In other words, I wasted 360 Dollars and 2 Month's when what I should of done is move to another Internet Service Provider. In other words, nothing's surer than Death, Taxes and Moving sale. By the way, Andreas. I haven't heard from you in a while. I hope everythings going well.

==Thanx==

Well, I already have the .atr disk images, and I know of a couple of places online you can get them, for various platforms, including IBM, Commodore, and the Atari. I've also gotten copies of the docs for some of the other versions, but either they are wrong or they do not work to defeat the particular game protection inherent to the Atari version. (Its the old look for a certain word on a certain page in the manual kind of protection.)

If you want, I can send anyone the .atr images I have, but I also know you can find them at places such as Ken's Atari page and others.

For certain the commodore 1084 (all models) and the phillips CM833? (which is a Commodore 1084 by the people who actualy made it). I have a 1084s that is quiet happy with my 800xl, 130xe but is a bit shaky soundwise on my XEGS. Some people can only get theirs to display black and white/monochrome. There is a hardware fix in the FAQs re this.

The ataris actualy output in compisite video mode.

For cable i use an Audio Din plug (matching atari monitor output plug) to RCA cable, and a couple of y splitter, works just fine.

Keep an eye out for the FAQ when it comes round and have a look, IIRC it has a list.

Hello Simon,

I remember you from the Ol' Hackers days. Good to see you here! Gee, I wish I had an answer for you, but I, too, have been away from Atari hardware for a while. I do my 8-bitting in emulation on a PC :-(

It was inevitable. I just ran out of time to pursue that hobby and room for the hardware, software, etc. But I keep a hand in it by staying in touch with this newsgroup and going telnet to several Atari 8-bit BBSs using terminal simulation programs written by Tom Hunt and Stephen Tucker.

Take care.

Alan

On my home page you can find a program that will generate .wav files
out of cassette data. However, it is written for use with .cas files.
If you can write a PC program to convert .com, .exe or .bin files to
.cas format, then you could use my program to convert that to .wav and
record it to tape. The hardest part in this is that you have to add
some sort of boot loader, because you have no dos loaded if you do not
have a disk unit.
My stuff can be found on
http://home.planet.nl/~ernest

Keep those XL's/XE's buzzing.
Ernest.

They write to the ATR (as long as its not read only)

Games that require a separate save disk just need an ATR created
(Alt+D) in Atari800win and 'new image' chosen. When the game asks for
the save disk to be inserted then just attach this new image to the
drive..

Yes, it does, but only if the images are single density. Afaik Sherlock
doesn't support enhanced or double density disks/images.

> Second, and similar question. I started Seven Cities of Gold and it
> called for formatting a new data disk. What actually happens when it

If you don't have an empty image available as D1: (D2: ?) nothing will
happen. Emulators don't format your C-drive (however there is a tricky, but
easy, way to corrupt some things on your PC harddisk by just starting an
Atari file)

Yes, it's not an XL/XE(gs) game. It's for the Atari 400 / 800. To run it, you have to boot the 800 o.s. first, but I doubt it will work with Multiboot menu. It does work however with other menu's, like SpeedStartInit for example, but you will loose the high-speed loading after the old o.s. is installed (if the disk drive supports it, that is)

I'm having problems getting Pogo Joe onto multboot format - I keep winding up with a 3-sector long program!

Has anyone managed to find Pogo Joe on multiboot format at all? Seems a bit of a swine to transfer.

Also any reason why Rainbow Walker fails to run on an XEGS system?

Thanks, Dunx

You probably need to get it first into one program. The files are often linked together into a long file, but actually they are fragmented. I usally use something called Codebuster. I load the first part of the program in and then I apped the rest. Note which start address and end addresses as well as run address. Then if it's completely loaded, save it back with the right numbers for start, end and run.

Multiboot requires nonfragmented (if this is the right word ???) and this usually works fine for me.

2870. Resistors for Super Video for 130 XE

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-20 15:08:30 UTC
From: llpwhite@cs.com
Message-ID: <20020520110830.11025.00000411@mb-mm.news.cs.com>
Source record: 29439

I'm getting ready to upgrade another 130XE, and instead of "piggybacking" resistors, I'd like to order the exact values that are needed. In the original article, resistors were added at several positions such that the parallel resistors provided the desired resistance. (or)

Rtot = R1 * R2 / (R1 + R2)

But there is one position where *three* resistors were combined in parallel. Do you calculate Rtot by first uning the above formula for two resistors, then using the same formula with the combined resistance and the third resistor?

Rtot = Rtot1-2 * R3 / (Rtot1-2 + R3)

Thanks,
Larry

Yes, this method works. IIRC, the general formula boils down to:

Rtot = 1 / ((1/R1) + (1/R2) + (1/R3) + ... (1/Rn))

It is either wrong or someone modified the system by replacing the built in ROM. Modified systems are not necessarily bad, some of them have expanded memory and built in monitor.

Does the system work when you boot a DOS disk or have a cartridge inserted? If so, I would just put an SIO2PC cable on it and use a ROM image for Atari Basic. It would also let you know how much memory you have in the system if you tried to load a ramdisk.

FWIW, on my XP Pro system here at work, a 528 byte log file takes up
4.0k on a 20 gig NTFS partition, so 4k allocation units would make
sense. So, the extra <500 bytes that the MakeATR programs adds will in
most cases make no difference at all in disk space used up. :)

I had no problem running it on multiboot way back when, in fact when
transferring floppies to ATRs recently I came across it. My multiboot
loader of choice was one that I found called "Fenders", I don't know
if anyone else remembers it.

Great game!

Most likely is that Pogo has a small loader just reading in 3 sectors
that displays a message etc and then starts again at the next sector
to read in the main game. Most stuff I added to MB had that as I
didn't want to edit the main file to add a 'cheated by' etc..

Please help me find emulated copies of these games (ROM files, etc):

BERSERKER RAIDS
WINGS OUT OF SHADOW
WIZARD WAR
PRIDE AND PREJUDICE
SIGN OF THE WOLF

They were released between 1982 and 1989 and were made for: Apple II series 48k, Macintosh 512k, Commodore 64, Atari 400/800, IBM-PC, IBM-PC jr. They were made and distributed by Berserker Works Ltd., run by science fiction author Fred Saberhagen and his wife Joan Saberhagen.

I am trying to find these files so they can be included on a CD of historic software for a forthcoming book. I am working with permission of the Saberhagens. I need to find copies ASAP. Apple || copies would be best, but ANYthing would help. Thanks much

Like you haven't heard that before...

I'm just getting started with Atari800Win Plus 3.0, and I'm banging my head against the wall.

Problem 1: I load with any DOS (2.0, 2,5, Sparta, whatever) and go to access the cartridge. It ALWAYS says there isn't a cartridge, even though I've inserted one (ATARIBAS.ROM). BASIC is not disabled in any of the emu's settings. What gives?

Problem 2: Using ATASM, I create a disk image. The emu can see the disk, I can get a directory from it, but I don't know how to (L)oad it (sorry, the only manual I have is for DOS 3.0...DOS 3.0 can't see the disk image created by ATASM.

Hopefully someone can steer me in the right way. I have tons of stuff I'd like to do on the Atari.

-Don

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I didn't get a disk drive or any accessories other than the keyboard and
light gun that it came with; the only cart I have so far is Star Raiders,
which boots and plays just fine. I don't know much about how to load ROM
image files or connecting it to a PC. No idea what a SIO2PC cable is or
where to get one either. -_-
Do you think this would be worth looking into or should I look for a
"factory" system?

Makes it a bit tough to give advice since if it is a hardware problem a SIO2PC cable may not work. Kind of like advising you to spend $5-$20 to see if your computer works.

Clarence did about as good a job as can be done making a SIO2PC schematic. http://www.redshift.com/~cdyson/sio2pc1.html

Most people just build the 1489/75189 version as it is simple and works. If you don't have an old DOS based PC you would probably want to build the DSR version vs. a switched one. Don't put in the 5.6k pullup resistor, I don't know how that got in the design.

You can order one on eBay, one of the newsgroup regulars sells them there for about $15 + shipping. Once again, if you are using Windows only I would ask for a DSR version as the best option is Steve Tucker's APE software for windows.

As far as is it worth it... We had a poll in the newsgroup a few years back and I think something like 70% of the respondants said SIO2PC was their favorite periferal for their Atari. Considering a lot of people are using the emulators now and going from memory vs. owning one, it was a pretty good showing.

What the software and cable do is convert your PC into an Atari style drive. You can do anything from simulate an Atari 810 to eight 16 meg hard drives hooked up to your Atari at one time. The PC side software allows for hot swapping simulated drives so you really have a lot of storage available. That is why the discussion is going on in another thread about how game files should be distributed, binaries or in the .ATR file format used by SIO2PC.

It really makes storage and game play much improved over the orginal systems. Games like Ultima III and Alternate Reality that were crippled by slow I/O are really playable with an SIO2PC cable.

2888. Steve Dong Heavy Metal

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-21 17:53:17 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3cea8988$0$3579$1dc6e903@news.corecomm.net>
Source record: 29309

I have been going thru some old stuff.
I had/have a Steve Dong disk called 'Heavy Metal' if I recall.
It has 8 Dong pictures on it. It is/was a boot disk, if I recall.
It tries to boot, but doesn't work. One of the pictures is called
'SHORE.PIC' and, like most Dong pictures, it is a binary load file.
The other pictures 'GIRLSTAR.PIC', 'GARF.PIC', 'GOMEZ.PIC',
'ROHAN.PIC', 'SWDGIRL.PIC', 'VAMPIRA.PIC' and 'TURBO.PIC'
aren't binary load pictures.
Does anyone have this compilation they would share with me?
B&C Computervisions has a PD Heavy Metal disk, which I think
is the one.
Or, alternatively, I think these are 'Fun with Art' pictures. Is there a
'Fun with Art' PIC viewer?
Thanks
Russg

There are already flags in the filenames to indicate which games
require OSb. For example:
Ghost Hunter (19xx)(Arcade Plus)[OSb].atr

(I love Ghost Hunter... one of my all-time favorites, I'll have to dig
out my instruction manual to see if it has a year on it...)

Is there a utility that runs under Windows similiar to AtrUtil that
will format a new ATR, but using Atari Dos format ? When I use
AtrUtil to format a new ATR as MyDos format and insert .bas files into
the ATR for execution using Atari800WinPlus 3.0, I get 164 errors.

I use Steven Tuckers APE for DOS v.118- it's meant to be used with an SIO2PC cable, but you could use it to create ATR's as well. After creating them you'll want to mount them in d2 in the emulator and format them with the DOS of your choice in d1.

2893. Super Video

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-22 02:54:42 UTC
From: Chris Martin <vlastaar@yahoo.com>
Message-ID: <SLDG8.2851$cQ3.518@sccrnsc01>
Source record: 29314

All,

I know it has been talked about before, but I just did the Super Video mods for the 130XE (http://www.redshift.com/~cdyson/sv130-1.html) and this looks great. It is like looking at the emulator with the artifacting turned off.

However, I have to admit that using S-video without the Super Video mods also looks quite good. (I took a PC keyboard extension cable, an S-video cable and a male/male RCA cable, to create the uber-8-bit-monitor cable with S-video, composite video and audio out.)

I highly recommend making one of these cables.

Anyway, that is my 2cents.

Have you tried TUGED from the old school emulation center? It's limited to it's database, but that's pretty extensive. It will rename all of your zip's with the filename, date, crack, OS, etc. and it will move duplicates to a 'dupes' folder. I really like it. I can't find the link for download right now, but do a google search and you'll find it.

2898. Atari800Win, M.U.L.E. & joystick/keypad problems

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-22 16:21:32 UTC
From: Marjean Cline <marjean@rtinet.com>
Message-ID: <acggdt$km4$1@quark.scn.rain.com>
Source record: 29319

In a fit of nostalgia today, I did a Goggle search for "M.U.L.E." and found, much to my surprise, an Atari emulator for my PC
(Atari800Win) AND
the files necessary to play M.U.L.E. Did the downloads, fired it all up and have gotten as far as the opening page of the game.
NOTHING I try on either my gamepad, joystick or keyboard allows me to press "option" or "select" to change the level of play or
number of players NOR can I find the correct key to "Start" the game either. All I'm getting are the opening animation and the
great, funky music - I am frustrated beyond all belief!

Can you kind people help me?? We had this game for our original Atari and played it constantly. I'd love to surprise my husband
with a playable version on our PC.

Thank you in advance for any help!

Righty....

Make sure your joystick is calibrated in the Control Panel / gamepads
and obviously that it exists in there too :-)

Then you do have to select a stick / Pad to use from the INPUT menu,
by default it's set to either none or keyboard (can't remember for
sure) but it does need to be set to your current pad / stick.

Now use F2 for OPTION, F3 for SELECT and F for START..

F5 is RESET or Shift+F5 for a full coldstart...

If all this fails then leave a message back..

Thanks for your help, Paul. I finally managed to get it configured to play with the keypad, but the only options showing in the
joystick options are "Keypad" and "None or Template" - and to make matters worse, I can't get my system to even acknowledge my old
Gravis joystick, much less let me calibrate it. This all reminds me of the difference between what was under the hood of our old
'68 Chevy pick-up and what I saw when we went car shopping a few weeks ago. At least I could find things in the old truck!

But I can now play the game with the keypad, and even though I'm not as quick with that as I used to be with the joystick
(especially when my time is limited because of a food shortage!), I can sit here and waste a few hours as a purple Leggite trying to
outdo those pesky Mechtrons! I'll try a few other things when I have the time and maybe I'll be able to get the joystick to work.
My better half will be thrilled to have his old game back!

Lol..

I'd pick up and old gamepad from your local PC place, they are so
cheap now, I'm picking up a 10 button, dual analogue, vibrating all
sing and dancing pad for 7.99UK which works perfectly under 98/XP
called the Blaze Viper 3D.

Any other pad should cure the no pad problem you have, I seem to
remember the Gravis needs drivers from a floppy disk before Windows
can see it.

Are there any kits still available to expand the memory on an XEGS system?

Thanks, Dunx

I have a question, I just get a atari 800xl with a disket machine, I never has used a atari with disks, when I write DOS in the atari it shows the self test screen, I have to get the dos on disk if is there how I can made it.

I use atari800win emulator and I play games in atr format this games can I convert to be reader by the atari?

thanks

I know it is extremely naughty of me to even think of asking this - but
I would really like to play that old adventure game The Pawn, but
because of that bloody copy-protection scheme I can't...

I have a copy of the manual, but since it's in text-file format it
doesn't help very much. What are my alternatives? Can anybody help?

Peter

Do a search on the web for Magnetic Scrolls and you'll come across the Magnetic Scrolls memorial site. This site has info and links for Magnetic, a program that allows you to play old Magnetic Scrolls adventure games on modern computers. There are versions for Linux, Windows, Mac, Amiga and Atari ST.

From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3CEE7AC2.D1DF4B02@students.uni-mainz.de>
Source record: 29334

Well,
I am not mising this info, I am ignoring it !! Because that 14k space is
RAM under the OS ROM (it can be used as a Ramdisk, but with many
compromises). Besides that, you were not the only one who told me that.
Maybe I should include this info into my RD info text - on the other
hand this would mean that I also have to include all RAM upgrades for
400 and 800 computers, as well as all RAM upgrades for the 600XL. At the
moment I am not willing to do that. My main reason was to list Ramdisks
/ extra Ram beyond the 48k or 64k "normal" RAM: Especially I wanted to
list the Rambanks of these extended machines and several lists of
programs that work with one or more of these upgraded Ataris...
-Andreas.

P.S.: But thats surely not the last word here - tell me your opinions
and I might change mine...

Hello Wes,
its really cool to get some infos directly from the developer. At first you must know, that I am living in Germany. Thus Newell Ramdisks are not the standard here (Compyshop Ramdisks are). Most (if not all) of the guys who own a Newell Ramdisk here reported to me that it lacks the Antic access (separate access of Antic and/or the CPU to the extra Ram). Thus the programs "The Wedge 2.1" by Ed Bachman and "Video Blitz" by Helvetica Bold which are the only programs I know to use the separate access do not work on their machines (they also do not work on Megaram 1, 2 and 3 ramdisks, but there were some Compyshop Ramdisks, not called Megaram which had the separate access). ABBUC which is also a german Atari club has many Ramdisk schematics, they also have some Newell schematics and it looks like they merely have the old schematics where Rambo XL compatibility and separate Antic access is missing...

Well, maybe I should simply change the list and mention that there were/are two versions of (every?) Newell Ramdisk, the newer one which is Rambo XL compatible and the older one which is not. Concerning Antic access I merely have the information from some german Atarians who told me that their Newell RD does not have it; guess they do not own "original" newell ramdisks but rather selfmade ones (so-called compatibles) and left out that Antic thing because all over the years the Atarians have been told, that there is no program which uses that separate access. Now we know: there are at least two programs and maybe more (which I do not know by now), thus separate antic access should be available, if possible... greetings, Andreas.

P.S.: As I said at the end of the info text, I am a novice in this subject, so I must believe almost everything the Atarians tell me...

Hello Russ,
I have that disk, as well as some FWA loaders and converters. Can send
you a copy next week (so far I searched the whole Pooldisk Too for every
FWA picture and now I have 2 medium/enhanced density disk sides filled
with them). do you just want the FWA pictures or also the Binary pics
and/or FWA converters ?? -Andreas.

Hmm,
that makes me wonder. All Rainbird titles (Jinxter, Guild of thieves,
The Pawn) that were sold here in Europe did not have any copy
protection. More than that, they all contained two disks, but on every
disk only side 1 was filled with data, whereas side 2 was empty. Maybe
they thought that some disk drives (like Chinon XF drives) cannot read
the second side of a disk at all... -Andreas.

2917. Atari810 Update

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-25 19:31:46 UTC
From: Dan Vernon <dan@retrobits.nospam.net>
Message-ID: <acooko$46p$1@news.chatlink.com>
Source record: 29338

Hi all,

just updated Atari810 to ver. 1.3. It now supports high-speed disk I/O (2
times standard SIO speed), like an XF551 or Happy drive.

Download it for free at:
http://retrobits.net

-Dan

Use only Single and Double density (90 & 180 KB) - be ok! If You use medium
(130 KB) - be problems :(

thanks for the reply. i found this also to be true. eventually i did
get it to work with single density and had difficulty with enhanced
density.

Many years ago 1985 if memory serves I purchased a brand new 800xl 1050 disk drive 1702 commodore monitor and an atari modem and printer, Those are long gone now but I am re collecting some atari hardware and software, does anyone remember how you copy a binary file from a cassette to a disk? Many years ago the BBS's were full of this information but my memory is not what it was and I would like to move some games from cassette to disk.

Thanks in Advance

CopyCass is the best utility I have used for that purpose; otherwise you must read the cassette data into a buffer and then dump it out to a disk file as DOS has no provision for this process. Basic files can be transferred after booting DOS with the simple "CLOAD" and then SAVE"D1:MYFILE.BAS.

There is also Cas2Disk to make a boot disk from a boot cassette.

Hi,

Thank you. I used version 1.1 quit a lot. This program works fast and is
reliable....good job.....it seems that it's working on Windows XP aswell???

I'm going to try it out tonight.

Chris

IIRC I've seen these pictures before. A guy from Eastern Europe built them
(if those are the same pictures). His name is Jeri or Jery or Jerzy or
something like that.

Can you open it up and look inside?

IIRC the ROM is on the right hand side near the top right corner. Tell us what the number say. (if it's got a small window, the ROM that is, the ROM was replaced by an EPROM.) The ROM is not as big as the 40 pin chips. (in lenght that is)

Howdy Dunx

> Are there any kits still available to expand the memory on an XEGS system?

B&C still has the Innovative Concepts 128kB upgrade for the XEGS in it's
list (last updated in April)

CU Mathy van Nisselroy

PS as soon as i get the bugs chased out of my upgrade, I'm hoping to get a
small production run going of my 1MB upgrade. It works 100% in my XEGS, but
my 800XE has a week CPU and why it doesn't work in my 800XL still bugs the
hell out of me.
How does 99.9% 130XE compatible sound?
No loss of software control over BASIC, Selftest, OS ROM and on the XEGS
even Missile Command.
No funny addresses.
No screen flicker.

True,

130xeSD (I've seen 2 models):

-1 meg RAM (soldered on the 1st model and socketed on the 2nd)
-multi-rom boot (8 on the 1st with led display for the name of the rom/ 4 on the second with onscreen menu)
-of course 3.5 floppy drive
-sio2pc inside (on the 1st model not on the 2nd)
-stereo sound switch (with headphone plug on the 2nd)
-external slave 5.25 drive port (on the 1st model)
-I may forget some other things but I will make a page with more details and pics soon...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

2941. sio2pc cable connection questions

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-29 05:09:07 UTC
From: Steve Chamberlin <slc@pacbell.net>
Message-ID: <TnZI8.4991$8C4.137325915@newssvr14.news.prodigy.com>
Source record: 29263

I've got a brand new sio2pc cable (purchased from j131-- thanks!), and apparently I'm too stupid to use it correctly. Can anyone give me a quick explanation of how to get up and running?

I tried connecting the cable directly from my 130XE to my PC's COM1, launching sio2pc 4.19, loading a bootable disk image into virtual drive 1, and then powering on the Atari. I was expecting it to boot from the virtual drive, but instead it just booted to basic's READY prompt, exactly as if no drive were present at all. When I type the DOS command it just goes to the self-test screen.

I then tried the same drill using APE instead of sio2pc, with the same result. Then I tried daisy chaining a 1050 in between the Atari and the PC instead of connecting them directly, again with the same result. In all cases there were no error messages or other signs of trouble, but the Atari just acted as if the sio2pc cable and PC-hosted disk weren't there.

If I had a real bootable DOS diskette, I'd try booting that in my 1050, and then using DOS to query drive 2 (the PC-hosted disk). Unfortunately I don't have any real DOS disks, though, so I need to boot from the PC-hosted disk to get going.

Am I missing something obvious? Sio2pc's readme.1st tells me to read the file SIOINSTR.TXT for an overview of the instructions, but that file isn't part of the archive I pulled off the web site.

Are there any simple tests or diagnostics I can try to help find the problem? The sio2pc file DIAGS.TXT mentions some diagnostic funtions built into that program, but the menu options it describes aren't present in my version 4.19 of sio2pc.

Any suggestions?

Thanks in advance!

I've just bought a cable from j131 and I'm awaiting delivery, so I'll be
interested to hear how you get on :-)

BTW I thought that Atari810 from http://retrobits.net/ looks a lot easier to
use than native sio2pc. Perhaps that might help.

I've got two of his cables and they work flawlessly. I've had the best
results using Steven Tuckers APE for DOS v.118 be sure you go into the
configs and tell it you have a one chip cable and which COM port you're
using.

do you need to switch off basic when you boot (like with most game disks)?

I think its holding down select, or Options when you switch the Atari on.

Sorry, been playing with my speccy of late so its not on the top of my head!

Never used 4.19 so I am guessing it is like earlier versions. The monitor is a toggle and you will see a box on the bottom of the screen with things like "Last command" listed.

You should see a few lines<letters> changing state if you have everything hooked up correctly. If you don't see the lines/letters kind of buzz when you turn on the Atari then it is most likely you aren't configured for the right serial port. Kind of hard for all of them to be broke because of multiple chips to control the serial lines.

If it is only one of the lines that isn't moving, it is usually something simple like a bad solder joint or broken wire.

Success at last! The problem was apparently a software configuration issue, and not the cable.

I checked the COM ports and several other items suggested by the docs I could find, but everything seemed okay there. After many frustrating hours of experimentation with random configuration settings, I tried changing the APE "serial control" setting. When I changed it from the default (DSR) to RI, everything started working perfectly. Is that how other APE users have theirs set? I don't understand why this fixed the problem, but I'm glad it did.

Now I can begin work on my masterpiece 8-bit Atari game. :-)

2953. An unusual 1050 problem

Newsgroup: comp.sys.atari.8bit
Date: 2002-05-30 16:19:06 UTC
From: llpwhite@cs.com
Message-ID: <20020530121906.19978.00001252@mb-mo.news.cs.com>
Source record: 29274

I have a 1050 that has been acting up. When I turn the power on, both the power and the "busy" LEDs are lighted, but the drive does not spin or seek. I might have to cycle the power 4 or 5 times to get the drive to seek -- then it behaves normally. This drive had Super Archiver and a Bit Writer in it.

One person suggested that it might be the 3086 IC, so I desoldered it and replaced it with a socket and new 3086. No change. So my best guess was the 2793. Took the Bit Writer out, and reconnected the leads for the SA to a new 2793. Attached it to my system and powered it up. Wow! the drive seeks and behaves normally at power up.

So I thought I had better run the Archiver diagnostics. Put the the SA disk and booted the computer. Nothing -- just that awful "nak" sound. Checked the dip switches. They are properly set. Maybe I messed up the 3086 installation, so I removed the SA and installed it in a known good 1050. Works like a champ. Put the "old" mech in with the "new" board, and I'm back to square one -- that mech will not respond. These are both Tandon mechanisms.

Can anyone shed any light on this? I have never seen a mechanism that failed in this manner. Also, a bad 2793 and mech? Doesn't seem likely.

Thanks,
Larry

SIO2PC always used the RI line. A "true" SIO2PC cable will have the RI line connected. APE (for DOS) can use either. A better route is to have a toggle switch so that either the RI line or the DSR line can be selected. I have only seen pictures of the cable you purchased, but looks like adding a switch would be difficult due to the compact nature of its design.

What PC hardware and OS are you using? (CPU speed, and com port usage, mainly.) If you use Win 95 or Win 98 with APE for Windows, you will likely have difficulty using the RI line. With Win XP, things are better.

The Atari 810 is for Win 2000,NT, XP. It uses RI, also. It is recently released, but looks like it will be very good!

The only way to use an Atari 8 with an RGB monitor is by using a composite to RGB adapter as the A8 puts out composite video, chroma, and luminace. Any monitor that can be used with a VCR will work.

The DSR line has a higher priority interupt in the IBM BIOS so it gives
better performance when using APE under Windows.

There will probably be several performance switches over the next few years.
When everyone had a DOS machine RI was fine.
When people started migrating to Windows on slow machines DSR was necessary
for them.
Eventually we will be getting 2 giga Herz machines in Cracker Jack boxes and
it won't matter.

Source record: 29288

Hi 7800/XLE nerds,

i've two little problems (they are nearly the same)!

Problem one 7800:
I wanted to burn some of the prototypes i found in the internet but couldn't find any docs about the bankswitching cartrides (7800) and the used rom types.

I could modify a Xevious 32KB cart to run the internet version of Xevious and Pete Rose Baseball, everything (X/PRB) burned on a 27256.
Now i am trying to burn some 128KB games on rom and use a different cart Scrapyard Dog/Karateka.

How are the banks switched?

I also wanted to read out my original roms, what is the pinout of the roms that Atari used in the 7800.

Problem two XLE:
I need the Pinout/Chip type for the Atari XLE Supercartridges.
I am !!!!trying!!!! to modify some games.

I have the 1MBit Rom Emulator with the the doku/info from John Skruch/Atari.
They used 27128 eproms for the banks.

This info is on the homepage of Jindrush http://cat.asw.cz/~kubecj/acarts.htm look XEGS carts.

I am very happy about every info that helps me to go on.

Thanks, happy Atari 8 Bitting

PS: I looked at many 7800 homepages but the don't described the functions of the jumpers nor the pinout of the used roms.

Source record: 29290

Torsten,

Your right, there isn't much documentation about the 7800 cartridges. About the best info I found was on Dan Boris web site. He has some descriptions of the type of boards used in some 7800 cartridges he has taken apart. This would give you at least on idea of which cartridge (if you have extras of) to rip apart and use.

The basic premise behind 7800 bankswitching evolves around the use of a 74LS373 or 74LS374 depending on the type of cartridge it is found on (Super Cart 1 or Super Cart II or Supercart III). J.A. Valdez was the Atari engineer whose name I saw associated with a lot of the 7800 cartridge designs.

The 373 or 374 is used as a high address line switcher. Data lines D0 - D2 are used to select one of 8 possible banks. A bank can be selected by writing a value between 0 and 7 to any address in the range of $8000 - $BFFF. Bankswitching on the 7800 is described in the 7800 Developers manual.

Bank 0 thru 6 reside in the $8000 - $BFFF region of 7800 memory. These banks correspond to the various 16k chunks in an EPROM. For example a 27C010 EPROM can hold 128K bytes of information. It can also be looked at as eight 16K byte banked ROMs. So banks 0 thru 6 will be these 16K byte banked parts of a 27C010.

Bank 7 is mapped to $C000 - $FFFF region of memory. And is also the last 16K byte chunk of a 27C010 (if the game goes on a 1Meg ROM).

You can also have extra static RAM on the 7800 cartridge or extra ROM. This RAM or ROM is mapped to the $4000 - $7FFF region. The RAM is either a 6264 (8k byte) or a 62256 (32k byte) static RAM chip. 16k chips were never developed, that's why a 32k is used (in fact the 7800 developer board does a neat trick by using that extra 16k to store the debugging code). And the ROM chip is typically a 27128 EPROM.

One big problem with the 7800 game boards that use 1Meg of ROM space is that they were designed for Mask programmable chips only. Meaning that the chip is program when the chip die is made (hard coded into the chip). The chip is only 28 pins in size. All EPROMs of that size are 32 pins. So you have to do some creative soldering to make it fit. Fortunately, the majority of the pins are in relative same position if you align the chips from their bottom ends (pins 14/16 and 15/17 end; opposite end of the notch).

Besides the Supercarts on the 7800 there is the 32k and 48k carts. The 48k cart is just a modified 32k cart. So depending on the size of the game and it's memory requirements, there are lots of choices on the 7800. There a

web site out there that also has a hardware hack for the 7800 to allow you to dump carts onto a PC and convert a basic 7800 cartridge into a 32k byte storage device to do hobbyist level programming on it.

I believe the XEGS Super Carts do some of the same basic switching except that it's confined to the cartridge port memory in the Atari 8bit. It uses a 74LS374 type of chip and the Cartridge Control Line, CCTL signal, to do the switching with. Switches out a 16K bank at a time. The XE Demo Cart is neat in it's ability to switch between games by doing a power cycle on the computer. Uses a capacitor as a power source to keep the memory circuit alive long enough to remember what game it was on before power was turned off.

Well, I hope I gave you enough information to move on with your project. Good luck. I'll email you a chart that I have on a 7800 cart jumper settings that I have in a Word document.

Regards,
Glenn Bruner

You should probably save up and buy a PC or a MAC, but if you must own an Atari I would go for the 800XL. It's my favorite 8-bit even if I own a 130XE right now. The 800XL is probably the most compatible for gaming (aside from the 800) and has a great keyboard.

Ok, you can make your own format configurations for Happy. My questions are:

- How did you do that?
- Secondly, do you know how to use that feature as a copy protection?

I'm asking you because I'm planning to make phantom sectors, and I don't know how to detect the different format configurations.

And yes, I knew that that the Happy can use enhanced and true double density (I'm one of the lucky owners who has one of them), but I just could use the total features just for single density. If you have an application that can help, I would be very grateful. Thanks.

Guillermo.

The 1200xl would be a better choice if you want something to hack or as a collector item. The 1200xl also has a slightly better keyboard so a lot of people prefer them for programming or word processing.

The main difference between the two machines other then layout is built in BASIC on the 800xl and the parallel bus. Since a lot of programs were written in BASIC you may want to go that route rather then buy a BASIC cart.

I have to agree with Richard. For all around good feel and use, the 1200XL
is the better choice. 800XL is also good, don't get me wrong (my first
Atari was an 800XL).

But if you're handy with a soldering iron, the 1200XL has many more choices
of hardware hacks. You can add a parallel bus to it, put an
internal IDE hard drive, upgrade the video, and some others. The keyboard
has the best tactile feel than any other Atari machine made!

Only draw back is that Basic is not built in. But this is good if you have
Basic Rev C on cart. Rev B is built into most 800XL's and has some
bugs in it.

And the power supply for the computer is the same as that for the 1050 disk
drive. More easy to find and repairable compaired to the
power supply used for the 800XL. The sealed 800XL power supplies are not
fixable when they burn out. The disk drive power supply
has a fuse that can be replaced if you carefully crack open the case (gentle
raps with a hammer on concrete to loosen the gluing inside).

1) I've used a program called "Formator" which was published in the German "Atari Magazin" (2/87).

2) Yes, I've used it to create a simple protection for the "Mega Magazines". If you need help, contact me.

I like to add here that I've been working on a new protected disk image format. Unlike the PRO format I want it to be an open format and it should be discussed by some more people who have knowledge about disk formats and copy protections. The goal is not to pirate software, but to preserve those originals in line with the Atari Preservation Project. Any help is welcome.

Freddy.

2984. HELP, for new Atari 130XE owner

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-03 19:22:20 UTC
From: John Stringer <john.stringer1*NOSPAM*@ntlworld.com>
Message-ID: <EIPK8.1431$u5.115375@news8-gui.server.ntli.net>
Source record: 29205

Hi,

I've just purchased an Atari 130XE with 2 1050 hard disk units and literally hundreds of disks at a car boot sale (flea market) and I'm stuck and in need of some knowleable advice.

Basically, lots of the disks are copies and when I boot them in either 1050 drive they either:

1) Display a black screen, with the following white text "Double Density Sectors Free: <nl>US - ALPHA LOAD"
or
2) A multicoloured Atari Logo with lots of corrupted characters beneath it

I'm presuming that these disks use some sort of boot loader perhaps associated with a specific boot disk application or even a hardware adaptation of the 1050 disk unit. Any help on this gratefully received?

I also have a disk with "The Super Archiver" written on it, does anybody have any ideas what this disk contains?

Thanks in advance

John

2986. OSS Super Cart Problem

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-04 02:19:50 UTC
From: llpwhite@cs.com
Message-ID: <20020603221950.16049.00000128@mb-mo.news.cs.com>
Source record: 29207

This must be my "turn in the barrel" for hardware problems. My Basic XE cart just took a dive. Over the years, I have had several SuperCarts (SC) that just stopped functioning. This cart worked fine a couple of weeks ago. My other OSS/ICD carts presently work fine.

Cleaning the "usual suspects" of dirt/oxide on the cart edge connector and eprom contacts makes no difference. The eprom also check good (my burner can read it). Are there any "weak links" in the cart? I hate to just blindly start desoldering IC's and components and replacing them.
Thanks,
Larry

> I have the opportunity to buy either a 800xl or a 1200xl I can only buy one of them and they are both the exact same price, which should I get? <

If you are technically proficient and have a desire to hack (read: desolder and solder), the 1200 XL is not a bad choice. If it is something that you want to work pretty much as-is, go for the 800 XL. The big advantage of the 800 XL is that it has the PBI (Parallel Bus Interface) which provides a fairly simple way to add a hard drive. Built-in Basic in the 800 XL is perhaps an advantage, but since Turbo Basic (disk) is so much better, it is not a really big deal.
Out-of-the-box, the 130 XE is the best deal, although some folks don't like the keyboards.
Larry

Hmm... although I am certainly not IN the US there are a lot of people in the
US using my cables... Check out my Ebay auction or contact me directly if
interested. CD full of software can be arranged too - but my bet would be
that it is cheaper for you to download software directly from the net.

Make sure you hold down OPTION when you switch on the Atari, or else the
multiboot disks won't load properly. They should display a list of games under
the logo. Type the letter associated with the game (A,B,C etc) to load and run
it.

2991. Re: HELP, for new Atari 130XE owner

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-04 16:04:14 UTC

Source record: 29212

The garbled characters are most likely due to BASIC being enabled on the
130XE in the display RAM area; boot while pressing Option key.

I have not used the Alpha Loader, but the 'Double Density' prompt seems to
indicate that the 1050 has been upgraded from stock condition.

"The Super Archiver" is a drive upgrade giving capabilities to create or
duplicate some disk protection schemes.

2992. Atari Computing Museum at Midwest Classic

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-04 16:32:52 UTC
From: wgungfu@alpha2.csd.uwm.edu
Message-ID: <adiq3kjvo1@uwm.edu>
Source record: 29213

June 4th, 2002 - Midwest Classic Host Large Display of Vintage Computers

Let the Midwest Classic take you back to the glory days of personal computers, when people had choices beyond a Windows or Macintosh based computer. Sponsored in conjunction with the Classic Gaming Museum, the Classic Computing Museum features a large display of 8 bit and 16 bit computers from the industry's beginnings in 1975 through to the last days of the 16 bit computers in the early 90's.

Of special note this year is a large section devoted entirely to Atari computers, and will include many hard to find Atari peripherals in their pristine condition. Visitors will also have the opportunity to leave their mark on this historical event by stopping by at the Atari 400 Guest Station, where they can enter their name and a personal saying for other visitors to read.

The Classic Computing Museum will have a large selection of items on display for visitors to see, learn about and play. Each display will contain a small description and history of the items in the display. Not all items on display will be playable. Classic computing expert and ClassicGaming.Com editor Marty Goldberg will be on hand to answer visitors questions and guide them down memory lane.

"I look forward to exposing people to a rich and vibrant history they may not be aware of." said Marty. "Likewise," he continued, "those who are old hats to the subject will be pleasantly surprised as well by the extent of the display. Definitely something for everyone."

More information about the Midwest Classic may be found at the Official Midwest Classic Web site at the GOAT Store, LLC (http://www.goatstore.com). Dan Loosen can be reached at loosen@goatstore.com and Gary Heil can be reached at heil@goatstore.com for more information on the event.

Hi,

That did the trick. Thanks for the advice. Now for a bit of sorting :)

Cheers
John

UPDATES SINCE PREVIOUS POSTING
2002.06.01: update Dan Vernon - URL, email, Atari810 1.3b
2002.05.25: removed Computer STudio (Sheldon Winick) based on his
newsgroup posting on 5/25/02
2002.05.18: added Alltronics (vendor)
2002.05.18: added Zdenik Burian entry - FLOP disk magazine
2002.05.03: Bravo Sierra update again, added atari.org address variants
2002.04.27: Bravo Sierra updated (new isp)
2002.04.13: Christian Groessler's Atari800 For SEGA Dreamcast 0.6
2002.04.12: Atari800Win Plus 3.0
2002.04.06: Introduction: copyright lecture cut, IRC info updated
2002.04.06: update B.G. Micro, source for disk drive chips
2002.04.06: update Steven Tucker entry

------------------------------

Subject: Introduction
```

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Major" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No product can be developed by more than one developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
----
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: April 21, 2002

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

There were at least two track ball input devices made for the classic Atari series. Wico marketed a red and white model and a grey model was available from possibly Atari Corp. I never encountered that one by Interfirm Systems; does it have any dates on it?

Hello,
I have not been using the Atari for a number of years and would like to sell this stuff. Hardware - I have a 400, 800, 850, 810, 1050, SX212, 410 cassette, 1020 & 1027 printers. Also a box of spare 400/800 circuit pwbs.
Software - All kinds of games, service disks, translators, editor cartridge,etc.
Doc - 400/800 technical & modification info., variety of manuals and books on these systems, games & programs instructions, Antic/Analog mags.
I would like to get rid of everything at once. I live in Baton Rouge La.

I can't quite follow Mo's TUGED idea, what it does, maybe it is what
you're looking for.
I have a program that will calculate a crc16 of files on a disk.
You can specify *.* or *.BAS, or just do a whole disk. You can
have the program make a text file of the crc16s on a disk. I don't remember
if you could specify a filename for the text file, or if it will only make
a 'CRC16.DAT' file. I use it to make sure two files are the same, like
for transfers using SIO2PC.
It gives the file size and CRC16. If those are the same, it is pretty
likely
the two files are the same.
Just rambling.
E-mail me if you want a copy of my CRC16 for the Atari.
Russg

Could you send me a copy of that, I'd like to try it out. TUGED is part pf
the 'The Old School Emulation Center'. Here's their link,
http://tosec.org/
It's a very fast renamer, organizer that will catch dupes based on a number
of criteria, don't ask me what they are though. It's database dependent
though, so you need to stay up to date on the database. It'll even rename
files within ZIP files! I like it!
Mo

Source record: 29225

```
Well,
think the XF551 can do 32 sectors per track (SD/ED/DD) quite easily -
the OS has a bug, thus when formatting medium/enhanced density it
already does 31 sectors per track. Maybe 36 sectors per DD-track is also
possible with an XF551 - but what`s it good for ?!? -Andreas.

Well,
there once was a program for Happy and Speedy drives to create almost
any copy protection these 1050 drives could do. Even copy protections
that could not be copied with a Happy or Speedy... think its name was
"Disk Master" or something like that. Of course the german turbo 1050
enhancement (by bernhard engl) also had some built-in tool for that
case... -Andreas.

Actually, just turning it on should bring up internal BASIC, holding OPTION to disable it should bring up diagnostic. Holding Select should bring up Missle command(maybe with option). Holding down start causes cassette boot.

A blank screen can mean many things such as a bad cpu chip.

Theoretically, if you format is as single density and single sided, it
will look just like a DOS 2.0 disk and should work. You may need to use
an earlier version of Mydos(ATR). Not something I have played with.

> directory?

Standard config of Sparta-Dos hasn't got anything of a PATH feature. All commands has to be in the main dir. There is however a
util to add PATH support to some versions of Sparta-Dos. I tried it once and it didn't work, probably cause I was running it with
a Sparta-Dos version not supported by the util. I can't remember the name of it, but it was written by Tom Hunt. I have it
somewhere on my disks but should search for it...

b.t.w. BeWe-Dos has the external DOSDRIVE command, which does pretty much the same you want, but I don't think it'll work with
Sparta-Dos...

That sounds very strange. When it is possible to create a certain copy protection, I don't see why the same hardware can not create the same copy protection again.
Andreas, do you have knowledge about copy protections? What kind of protections do you think are not possible to re-create with Happy / Speedy? I know there is a limit to the disk-drive cash memory which can be a problem, but then it would still be possible to copy with a larger cash memory, or?

Freddy.

3017. Re: 8 Bit Power supply mixups please help

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-07 14:08:27 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d00be4c$0$3340$1dc6e903@news.corecomm.net>
Source record: 29237

The xl/xe machines use a 5 volt 7 pin DIN (round with a dimple).
Just about everything else (1010, 1050, 850, 800, 1200XL) use
a 9V AC smaller brick. The 1010 can use a smaller amp brick.
But all the 9V AC have the round +/- plug-in. The only thing
I can think to watch is if you have a power supply for an Indus drive.
It uses the same plug but is like 9V DC, or maybe 12V DC. Don't
use that on the 9V AC devices, or vice-versa.
There's a really good list of power supplies in the FAQ for this group,
see the 'Welcome to comp.sys.atari.8bit' message somewhere in this
newsgroup.

Source record: 29242

greetings..another kid on the sio2pc geekout mission.

could anyone run through the proper voltages at each pin of the 1489 chip
for a working interface. im getting rather frustrated with it as the
circuit is so
simple.

thanks

brad kraft

3020. Trade a XF551 vs. 1050?

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-08 00:09:09 UTC
From: Thomas Havemeister <twh1@gmx.de>

Source record: 29238

Howdy *.*!

I'm looking for a ATARI XF551 diskdrive unit. I'm ready to swap my
second 1050 drive for it. Is somebody (perhaps europeans/germans)
interested in such a deal?

Would be nice, if somebody could help me.

3021. 800XL with 256KXLE Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-08 00:15:47 UTC
From: Paul Barker <pbarker@ntlworld.com>
Message-ID: <R0cM8.1988$iK5.146407@news8-gui.server.ntli.net>
Source record: 29241

Hi

I've just been given a box of Atari stuff by a friend. Included was an 800XL which was very dirty and in need of a little TLC. I stripped the board from the case as usual to clean the plastics and decided to strip the RF shield also.

I discovered that the machine has been upgraded with what looks to be a 256K RAM upgrade. The only clue to it's identity is "256KXLE" which is printed on the PCB on the lower lefthand corner. (Hence my guess that it's a 256K memor mod)

There are connections from the upgrade board to the following on the XL motherboard :

PINS 12 to 16 on the PIA IC
PIN 9 on U30
Resistor R32
PIN 9 on ANTIC
U27 has been replaced with a socked and a ribbon cable to the upgrade board.

Does anyone have any info on this board. Is there any particular software which was shipped with it ?

Any info would be welcome.

It's a good job I took the RF Shield off as this machine was destined for my Sale / Trade list but I think I may hang onto it now !

Cheers

Paul

3022. Re: Super Archiver II.

I know for a fact that the Happy cannot do 'fuzzy' sectors. These were
usually sectors formatted on another make of computer that the atari
couldn't read. I dunno about the superarchiver, never had one.

Source record: 29245

(seeks 1489 voltages of sio2pc cable.)
Uhm. Are you sure there's a problem with the cable? I'm thinking
you did it right but may not have the pc software (APE or SIO2PC)
configured for either the RING or the DSR line. I think APE for
windows APE98 or something like that, defaults to DSR, and if
you made the standard sio2pc, you have the RING.
Russg

3024. Re: Which system should I buy 800XL or 1200XL? HeLP!!

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-08 03:24:11 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3d0178cb$0$89555$1dc6e903@news.corecomm.net>
Source record: 29246

The 1200xl was made before the 800xl, in between the 800 and 800xl.
Lack of BASIC isn't a big deal, as you can get a binary load BASIC
in either A, B or C.
The 1200xl doesn't have power at the SIO to run a PRC connection.
I don't remember how, but it is easy to put power to the SIO.
Adding a PBI is not easy, I'm pretty sure.
The 1200xl is a bigger computer, takes up more footprint.
Being bigger, it also has more room to put stuff in it.
Somebody said the power supply is easier to get for the 1200xl.
I think just about all 1200xl have socketed chips and later 800xl
had fewer socketed chips, in case you need to repair it, or add
modifications. The keyboard may be more reliable, I don't know
if the 1200xl has the same mylar as the later 800xl. My very
early 800xl has actual copper contacts for the keyboard keys, and
is all socketed.
It's a tough choice, and probably the 1200xl has a greater re-sale value,
neither one should cost very much in good working order.
I definitely think the XLs are more robust than the XE series.

Fox-1 and Thomas,
BeWee Dos and Spartados are compatible with each other. You should not have any problem with that at all. Matter of fact I use Spartados 3.2d and sometimes 3.3c and use BeWee Dos util Menu program and have NEVER had my system lock up at all!!!! I am not sure about the PATH ENVIRONMENT SETTINGS. Seems like I have always been able to type in commands at the D: prompt and had NO problems. What type of commands are you looking to access without having them on the root directory????? Possibly the COPY command????
Hope this helps.

Thanks,
Carey Christenson

Thanks for the link...very cool. A suggestion: make your background much wider. I run my monitor at 1152 pixels wide and your background wraps, obscuring text. At work my monitor is 2480 wide (dual monitors simulating 1 wide monitor), so if you can make your background at least 2481 wide I'd appreciate it :)

Howdy *.*!

Currently I'm playing with Spardados FTE /x32g. I want to build a sparda-dos based mega-image, containg several tools, compilers and so on. In doing this I thought of some nice directory-structure, just like with msdos.

but I could not find a PATH enviromnet set, something where I can tell spardados where it can find it's external commands.

Could it be done? Putting external commands in a subdirectory called "SDOS" ? Or must external commands always be placed in the main directory?

You may try TextPro. AFAIK it runs with Sparta, but am not sure about subdirs. (it does work with the MyDos subdirs).

Panther will run with Sparta, but leaving the program causes trouble (have to reset to restore screen). I patched my version to
let it exit properly, but it does not support subdirs. I use it by CWD-ing to the right directory and then run Panther from the
main-dir.

I have info somewhere about a way to make Atari Writer compatible with Sparta. They just changed the "mailmerge" feature to
execute a small binary to be able to CWD. Never used it myself...

Steve Tucker sells the sio2pc/ape cable and the Pool CD for $50
I think. Then you'd also need to register the APE software for
another $40, I think.
Steve's cables look short in the pictures, but a PC serial cable could
be added to it, maybe requiring an adapter.
Other than that, it isn't hard to build.

I never used it, but Text Pro is a favorite of many.
There is a separate directory for it and it's associated files at
ftp.spudster.org under the wordprocessing/textpro directory.
I don't know if it supports SpDOS directories.
I use Speedscript. It is too simple for your purposes and probably
can't specify directories for saves/loads.

There was an editor that I was fond of but it was more like using EDIT
within messy dos.

TEDIT was the name IIRC and I always used it for bbs files and anything else
not requiring
much for ATASCII graphics. Just a very good and small editor which I think
was
published in Analog Magazine.

If you need simple and easy then I'd suggest that. If you require it to do
more than
I think you'll have to use TextPro.

thx for your mail! I did have a look on bewe dos and it support
somethin like a path command. it's called DOSDRIVE.

Bewedos is not bad at all, but is strange incompatible when using it
with APE. Currently I'm building a huge mega-configured atari
Spartados images, which contains as much functionality as I can find
on net. Combined with the powerfull Bewedos tools in the spartados
environment, I was able to find my own solution for it.

So I'm using the "autocwd" command. I created a subdirectory "home" ,
where autocwd points after each reset or reboot, so the dos-utilities
in the root directory wont interfere my own dir-structure.

3042. A capable Text Editor on A8?

Newsgroup: comp.sys.atari.8bit

Howdy *.*!

Can somebody give me a hint for a very capable and nice Text-editor?
It should be compatible with spartados and support sub-directories of
it.

I have here "EDIT" from Compy Shop, which is very good at all, but not
that much compatible as I would like.

any hints?

No, not directly. You need to write a routine in machine-code which runs in an interrupt (usually VBI). When the routine is
running, you can use the lightgun in BASIC as long as you don't press RESET or so...

yes. it's a great tool!

But I have some problems in configuring it. When I start TextPro it
searches automatically on D1: for it's extensions. Well, that's not
the point for my spartados directory structure.

is it possible to reconfigure spartados and set an own path for it's
macro / addon files?

Hello Freddy,
unfortunately I must tell you that 1) I am not a programmer (not at all!) and 2) I do not know anything about copy protections. The program "disk Master" was once in my collection, but since I could not use it in any way I gave it 1996/97 to Stefan Dorndorf to further develop his QMEG-OS and Hyper-XF-OS. He "included" all the disk master`s copy protection techniques into his QMEG-OS or better he updated the QMEG-OS Freezer to properly freeze any of such copy protected programs. He also updated his Hyper-XF-Os in such a way, that the XF could read and write all those copy protections created by Disk Master. Therefore he wanted to write a special Backup Program (for the Hyper-XF-OS) that could duplicate all known copy protections (even Synapse, EA and others) but he never wrote this Backup program or simply never published it. After almost 2 years of absence, my friend torsten Schall now has e-mail contact again with Stefan. Maybe we are lucky then...

Concerning the statement, that Disk Master could create copy protections with a Happy or Speedy, that could not be copied with a Happy or Speedy is just something I read in the manual. Think the author used some copy protections that none of the Happy or Speedy Backup programs supported. in other words: it was not a problem for the Happy or Speedy enhancements, but for their Backup programs and probably also a problem for the track/cache buffer size. Compyshop once had drives that a) could create & duplicate any copy protection that was possible on Atari drives and b) other drives that were of industry standard and could create & duplicate any copy protection of 5,25" drives (Atari, Apple, commodore, etc.). Don`t know where these floppy drives have gone after the disappearance of Compyshop... -Andreas.

P.S.: You can of course ask Stefan dorndorf some questions about copy protections in the ABBUC forum (www.abbuc.de - in german or english). He has the knowledge about that and about many other things...

Well,
but you can use the Lightgun as a lightpen (and vice versa). Thus all
Lightpen games and utilities can be used with a Lightgun and all
Lightgun games and tools can be used with a lightpen. Already tested
this - but of course the lightpen is not as accurate as the Lightgun...
Afaik a lightpen driver is already integrated in the OS, so it should
not be a problem to use it under Basic... -Andreas.

P.S.: Think the fire button of a lightgun and lightpen are inverted to
each other (play OP. Blood the lightgun version with a lightpen and you
have auto-fire, the same is true for Crossbow and Crime Buster; very
funny !!!)

The ST should be able to read a standard 3.5-inch PC (DOS/Windows --
FAT format) disk, provided the ST supports the capacity (for instance,
most STs have just 720KB floppies, so they can't read 1.44MB floppies).

It could also mean a bad power supply. Before you even try powering up
the XEGS again (it may be too late anyway), check the voltage coming out
of the supply. Lots of times the failure mode means over 8 volts coming
out of that sucker. That is exactly how my son's system died.

3058. Old Atari Game Help Please

Newsgroup: comp.sys.atari.8bit

Hi,

I don't know if anyone's able to help but years ago I had a 3.5 floppy
of
three Atari games for an Atari 520ST computer - yup going back a bit.
All I can remember is the first one was about a spaceship which had
hundreds of coffins (hibernation boxes) with rooms and levels made up of

different colour references (although the game was black & white). I
can't remember the name at all I'm afraid but this is the one I'm trying

to find in possibly PC format. (The 2nd game was about a magic
garden...and I can't remember the 3rd!). Does anyone know
this old game? If so - I'd be grateful for any information
or re-direction you may be able to give,

Ta! Mike

Hello Andreas,

ok, i can use the lightgun as lightpen with peek(564) and peek(565) for the x and y position and with stick = 15 for the fire button, but this only work well very near to the tv set.
With games like barnyard blaster the lightgun also works 3m far from the tv set.
Is there anywhere a description about programming the lightgun (also in assembler) ?

THX

Hello,

What TOS is on the ST? If it is 1.4 (RainBow TOS) or above, just format
the disk in the Atari ST and then put it in your PC and copy files to
it. Then put it back into the ST and you should be able to copy the
files.

Nobody bags Bravo Sierra because it does not suit them. They bag them
because Bravo Sierra bags others first, unfairly and unjustly.

Perhaps when they stop that practice, I might - just *might* -
consider someday doing business with them. Until then, not a chance.

Mike

For the folks that offered suggestions, thanks very much. I decided to tackle this drive again today (the last repair session lasted until around midnight a couiple of weeks ago.)

In the clear light of a new day, I found the problem (he sheepishly reported). One end of the new 2793 was not completely seated in its socket. I re-seated it and then powered up the drive, and it now works perfectly. So it was only the 2793 that was the original problem (other than the repairman!)

Well, I've compiled version 1.2.2 from the tarball at sourceforge.net using
gcc 3.1.1 under Linux (kernel 2.4.18-6mdk) and it seems to work just as
advertised, but I have no sound. For now I've just run the XL rom
audio/visual self tests but I would think 8-bit Atari sound is generic
enough that there's no need to try running a bunch of apps or games to see
if the problem persists.

Anyone have any ideas or possible solutiins?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

3069. SPACE BBS now online via telnet!

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-14 05:44:57 UTC
From: Ilmarinen <friednw@tcfreenet.org>
Message-ID: <u$2#Pa2ECHA.1920@cpimsnntpa03>
Source record: 29190

The SPACE (St. Paul Atari Computer Enthusiasts) BBS is now online via telnet at spacebbs.no-ip.com. The BBS is run on a REAL Atari 8-Bit Computer! Nothing fancy available yet, however there are some games and such that might be of interest. I have received several HUGE ATR's filled with all sorts of games, utilities, etc. a while back (Over 6 MB!) that I am constantly going through and picking out all the games, utilities and such. Any questions, problems or comments may be left to me via Feedback on the BBS, via regular Internet email or here. See you there!

Howdy folks

Andreas: "Well, think the XF551 can do 32 sectors per track (SD/ED/DD) quite easily - the OS has a bug, thus when formatting medium/enhanced density it already does 31 sectors per track. Maybe 36 sectors per DD-track is also possible with an XF551 - but what`s it good for ?!?"

What would interest me is how far they got with the development of Speedy XF. I found an article in ABBUC Magazin (around number 40 somewhere) in which Klaus Peters talked about it as if it was finished. I know ABBUC now has the rights to everything Klaus Peters ever made for the Atari. I also know Rene de Bie bought some of the Speedy XF's but I seem to remember he told us they weren't finished.

Howdy folks

Sorry for the previous email that only contained what Ilmarinen wrote. A new problem has come up here at the computer pool at the university and when I asked the assistent to the SysAdmin, she tried sending a message. So the previous message came out. Sorry.

(Silly thing. Even though OE is set to automatically and instantly send out alll my postings to newsgroups, it will not do so. Today we (well actually the assistent mentioned above) discovered that my postings are send to the newsgroup if I go to send and receive and press send all.)

Howdy Bernd, folks

> Is there anywhere a description about programming the lightgun (also in
> assembler) ?

There is a site where you can download all the software ever published in
ANALOG Computing and ANTIC. Unfortunately I forgot where.

But IIRC ANTIC once had some routines for the lightgun.

(wants to run an .ATR on a real Atari.)
If you can get the .atr file, you must have a Mac or PC.
If a PC, there are utilities to convert an .atr to a .dcm.
(imagic.exe from www.atarimax.com)
There are also strait .atr to disk converters, assuming you can
get the .atr to the 8-bit, Tom Hunt has one for single density .atrs
called atr2disk I think. That utility can be found in the cth archive
at ftp.spudster.org (get the all.txt file and search the archive.)
With a .dcm file, you use Bob Puff's Disk Communicator 3.2.
also can find at spudster, to write the actual disk. Since you're
getting stuff on the PC, you need some way to get it to the 8-bit.
For that a sio2pc/ape cable is used, but then you could just use
the ATR and APE/SIO2PC on the PC and the cable.
But I ramble.

3082. help with XF551 disk drive

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-15 18:56:11 UTC
From: buckle64 <email@home.com>
Message-ID: <Xns922E7B126B13Fbuckle64attbicom@216.148.227.77>
Source record: 29103

Hello, I just purchased an 800XL and an XF551 disk drive, and I had a few questions. FIrst off, do the self tests on the 1200 ever end and report? Or do they just keep cycling.

Also, when I turn the disk drive on it spins breifly and stops. THat is all I can get it to do, is it supposed to spin upon disk insertion? How do I check the directory of the disk or load a program? I am trying to find some manuals but haven't as of yet, so any help pointing me in the right direction is appreciated.

Thanks

This is strange... when I boot up the 800XL and type 'dos' I get the
diagnostic screen. I thought that the 800xl didn't come with built in
diagnostics?!

>

I got the drive to work by turning it on first and then the computer (go
figure)... but, can I get into dos mode with the disk drive on? How do I
tell which version of dos is installed?

I'd assume the second game was called Feud, it's about two warring
magicians who have to collect herbs in a garden to make spells. An
excellent game (it was released on the 8bit as well).

Okay here we go, the 800XL does have built in diagnostics. If you plan on
using the disk drive you must have either a bootable disk or a DOS disk.
Turn drive on first, wait for spin to stop. Insert DOS disk, wait for spin
to stop. Turn computer on and either hold down the option key while powering
on or type DOS at the BASIC ready prompt. It's not a commodore, there is no
DOS built in! You need a DOS disk.

I'd like to hear of one if there is one, preferably in the South Bay.
Just finished playing a good game a M.U.L.E. on the trusty old 800 a
couple hours ago...

I would to. Can't guarantee I can be at every meeting, but once in a while
I could try and make it.

I live about 4 hour drive south at Vandenberg AFB. 8bit (800XL, 130XE,
1400XL, and 1450XLD), ST/TT, and Jaguar owner.

By the way, any one in this discussion attending CGE?

If the computer has a monitor output, and the TV has a SCART or video input, it'll probably work too. I don't know of any
NTSC-2-PAL converters. They probably exist, but I think they won't be cheap. Maybe another TV (multi-standard) is a better
choice?

Hi all,

I'm looking for a signal converter from NTSC to PAL; my television won't display anything more than a snowy black and white image. I'd prefer a dutch address (Mathy or Fox-1 ???), but any online site will do if that's not possible.

Thanks in advance,
Gertjan

An 800 or an 800XL?

XL's are fairly common in Computer Exchange who have branches in most
big cities but be warned, their pricing is expensive!

Other than that then it's boot sales and alike but don't expect to
find an old 800 easily, they are VERY VERY rare at boot sales.

Does anyone have an older version of the Happy (810) software that contains a program called MOTOROF.BAS (might not be spelled this way). Had it -- can't find it. It allows the timing of the drive motor shut-off to be varied. I am looking for this specific program, although I know that similar utilities exist.
Thanks,
Larry

I was up to the main shops in london 2-3 weeks ago

Retro X is gone (nice flower shop in its place, shame i'm allergic to
pollen!)
Notting Hill and the CEX retro shop seem to have dropped all older computer
stuff in favour of Sega's, Neo-Geos etc (all rather slack if you ask me).
I tried to get some CD 32 games they had in CEX, they were not on the
computer system so they would not sell them to me!

This leaves the auction sites (yahoo or Ebay, yahoo is much less crazy) or
getting lucky. Most charity shops will not touch electrical equipment, many
that do will not touch computers!

You need either alot of luck, or alot of money these days. You might stumble across one at a car boot - if you are there early enough. However the only other place is Ebay, and youll end up paying ?100 or more. I placed a "wanted" ad on an Atari ST hackers messageboard, and as luck would have it someone was giving away a load of unwanted 8bit stuff which included an 800.

3100. Value of large 130XE collection

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-17 16:43:54 UTC
From: John Stringer <john.stringer1*NOSPAM*@ntlworld.com>
Message-ID: <HkoP8.2297$cj4.148603@newsfep1-win.server.ntli.net>
Source record: 29121

Hi,

I managed to pickup a large Atari 130 XE collection recently and need to sell it on to raise some holiday funds and because I simply don't have the space or the time to sort all the disks. The collection includes the following:

Atari 130XE (reasonable condition - small burn mark on keyboard)
2x1050 disk drives (one of which has definitely been modded to support Alpha loads)
Analogue joystick which looks like it is used for flight sims
Around 7-800 disks which contain god only knows how many games. Many are only categorised using either a numbering or alpha-numeric system. I have managed to find one catalogue disk that lists around 800 titles.
Lots of disks boxes!

My guess would be that this collection once belonging to someone who was seriously into Atari and probably had some very good pirate connections.

Anyway does anybody have any opinion on what a fair price for this collection would be?

Thanks
John

Take a look at some of the few Atari retailers out on the net (Video 61,
Best, Bravo Sierra . . .) and see what they're charging for reconditioned
hardware. Alternately, peruse the listings on eBay. There are new listings
for used XL/XE stuff there every week. The prices of items near the end of
bidding ought to give you an idea of the going rate. For intance, last
week I bought a 130XE and 1025 printer (no disk drive, though, and no real
software to speak of) for $28.50 or so, plus shipping.

Was it a text adventure - sounds like Level 9 game called
'Snowball'. I think they made it into a 'graphic adventure' for the
ST (ie. text with crude graphics).

>
>to find in possibly PC format. (The 2nd game was about a magic

Could be the 'Silicon Dreams Trilogy' - 'Snowball', 'Worm in
Paradise' and 'Return to Eden'.

The XF551 only spins very briefly if you turn it on, not when you close the door. Unless it is upgraded somehow, then it might behave more like a 1050. Maybe there is a CSS XF551 enhancer in there.

Didn't Rene de Bie find one of these NTSC2PAL converters a while ago? For
something like 100 Euro's or so? BTW, the ABBUC (http://www.abbuc.de click
on SHOP) sells Atari to SCART cables.

> Does anyone have an older version of the Happy (810) software that contains a

program called MOTOROF.BAS... <

Still looking, but I was able to pin this down a little better. It is on the
Happy Backup 5.2 disk, and it is listed as MOTOROFF.BAS. I'm pretty sure that
it was on earlier disks, also, but is not on the 6.0 1050 disk.
Thanks,
Larry

Better yet, do a search on eBay (say, for "Atari 130XE"), then click
the "Completed Items" link in the "Show Only" area on the left edge of
the page. This will show you the final selling prices for all the
auctions that match your search criteria that have completed in the
past couple of weeks.

Of course, the tricky thing is finding a match to your specific
package. A 130XE alone isn't hard to find, and 1050 drives are fairly
common, but judging how much your disk collection adds to the value is
harder to judge.

Hi Kevin,

Thanks. I hope there are a few more developers out there who are willing to re release their 8bit programs as well. Pd, or shareware, either way would be fantabulous.

It's better for us who dont need emulators (probly most 8bittters) to run the programs not be forced to use an emulator to convert it into a useable format. it eliminates a time consuming stup in the process. Just download, dump it to the 8bit and extrasct with discomm. Heres a hint to emulator developers, instead of re inventing the wheel with new disk formats taht arent 8bit compatible, how bout including diskcomm support directly!

Are you downloading directly to your 8 bit then? Even when I had everything
set up for that I still found it better to download to an IBM at 56k and
transfer from there.

I get all fuzzy trying to understand.
I don't think James is downloading directly to the 8-bit.
He says (pardon not actual quote) 'download and dump to 8-bit'.
How's he dumping it to 8-bit?
Uhm. James, I don't think you need an emulator to change a .atr
to a .dcm. Actually I don't think any emulator does that.
My apologies if you are a Mac user, it answers you getting the file,
then maybe null-modeming to A8, but no converter for the .atr AFAIK.
Finaly I'll add that files should be .zipped or .arced. This saves many
corrupted files from getting around. If it gets corrupted it will show
up when it is unzip/unarced. Then there's Steve Tucker's authentication
of .atrs, but I think that will only be detected with APE.
Adding .dcm support to emulators would be a little inconvenient, essentially
the emulator would have to convert the file to a .atr to be of use.
But I ramble.

Hi Russ,

Yes I do use a null modem adaptor (have a pr connection on 8bit). I think for running stuff on the 8bit using discomm on whole disks and then using arc would work. I've done that during my bbs days and it does cut down the transfter time and disk space on the server.

Me neither.

> to run over to your PC, find the file and set it up.

Indeed. Besides using real floppies for most of my games (original, so many with copyprotection on the disk) I have 2 systems
set-up, both with a BlackBox with 676Mb SCSI harddisk. Guess what's faster: booting the Atari directly from parallel-bus harddisk,
or turn on the PC, wait untill it has started up, search for the right ATR image, load it into A.P.E, to start it up using SIO
speeds...

> I expect that many of
> us have many hundreds of 8-bit disks that already have data on them - why
> send them to a PC just so we can read them back into our 8-bits?

Right again. Not all Atari 8-bit users are searching the whole internet for weeks on their $xxxx PC system to find a copy of an
Atari-image of a game they owned years ago to run it on an emulator, making the game an illegal copy (you don't own the original
anymore), while they can buy used Atari equipment for a few bucks.
Of course I have PC systems too, and I even am a registered user of A.P.E. to make filetransfers between Atari and PC a lot easier,
but many emulator users don't even realize that the real hardware still exists and believe the whole scene exists of spreading as
much ATR's on the net as possible...

> That said, was there a procedure that we can agree on to get files onto an

"DiskComm" if you ask me. Some emu's allready have support for it...

Hmm, UK prices

This is what i'm prepared to pay and condition etc:-

130XE, about 30-50p Commonish, that should include power supply, tv lead and a joystick.

1050 drive, 40-50p Good ones are worth getting hold off. That should include power supply, SIO cable and at least a dos 2.5 disk (a copy will do, as long as it works).

'not original disks' 10-25p each, remember selling copies are a dodgy propersition, label them as 'consider as blank disks' or e-bay may refuse to take your advert (piracy issues still apply to 8bits!), your 700-800 disks should go for 70-80p

If bundled together set reserve at about 150p, start with a low starting price, may be worth selling the enhanced 1050 seperately bundled with a couple of hundred disks in addition to that.

Original games with packaging, sometimes as high as 30p for complete or even more if mint. I won't pay more than 15p myself.

Ebay want payment for you to use you them but the prices are the best there for selling (and sometimes gets very silly).

Yahoo auctions is more sensible for the buyer.

Actually, I think it's safe to say that most 8bitters still using
their machines use something like APE rather than dealing with clunky
and fairly delicate 5.25" floppies. (Also often unreliable, as most of
the disks are getting close to 20 years old now!) In such a case, an
.atr file is the best for both people using an emulator as well as
people using a real Atari.

It's certainly not fair to claim that emulator authors are coming up
with new formats, at least they haven't been for years - PC Xformer
came up .xfd, and somebody not long after came up with .atr, and
that's been it. I think the rational is that an .atr is uncompressed,
so that's one less bit of code that needs to be worried about.

If you're really anxious to put it on a real Atari, check the size of
the ATR - if it's less than 90k, it was probably created with the
'MakeATR" program (a giveaway is a "K" on the screen when booting), in
which case it can be easily converted back to a .exe file. If I ever
get some more time to work (along with another volunteer) on the next
TOSEC release of the Atari 8bit DAT, it will identify .atrs that can
are converted from an .exe file.

Hello,

I have been running my 130XE on a SVGA monitor for sometime. You need
to have three things: a 130XE or 800XL computer, a commodore monitor
cable and a video converter.

For the video converter try: http://www.mat-co.com

For the monitor cable try: http://www.myatari.com

Good luck

6/19/02
A little story about my A8s.

I made a BASIC program to load 62 sngl. dens. sector GR9 pictures into extended memory that Antic can see, the PORTB $C1 16K bank that the 130XE and the 256K Newell use.

My first problem was finding the correct place to do a Load Memory Scan in the Display list at bytes 100 and 101 of the DL. I eventually dumped a GR9 DL to a file and found that the first LMS at bytes 4 and 5 is at $x150 (eg. $8150) and the second LMS is at a 4K boundary (eg. $9000). Mine had to start at $4150 and $6150, so that the second LMS was at a 4K boundary ($5000 and $7000), looking at banked RAM of course.
I learned the hard way you can't try to have Antic display correctly if screen memory crosses a 4K boundary, if you do the memory is off, the picture is broken up in the bottom half of the screen.
Then I noticed that my 5th and 6th pictures had short streaks that flickered. Uh Oh, my 256k Newell is messed up. The program didn't have this indication of memory fault with my 130XE. The Newell can omit the wires 4, 5, and 6, CAS refresh, if you have a 21697 Antic instead of the 12296 Antic. I opened my 256K and it had the 21697 Antic. I noticed part of my connections may have been touching something on the mother board, so I wrapped tape around it. This seems to have solved the problem as my bank 3 no longer gives streaky flickers. My program just loads .GR9 pics off a disk until it runs out of files, 8 pics at a time, next batch of 8 hit a key. I have a collection of 40 .GR9 pics on a large .ATR image.

I haven't written a A8 floppy for a long time.
I have put everything I have on a single Zip disk on my pc.
If I wanted to write a floppy, I'd probably use Disk Communicator 3.2.
I do have some double dens. floppies, but probably would only use
then to give someone something for a real A8.
The floppies are getting scarce, and my several boxes of floppies
are getting very old. I poke into them sometimes and sometimes find
they have bit the dust, won't read, and it isn't my disk drive.
I spent about a month working on my real drives to try to give them
a cleaning a check-up.
I put a USB mouse on my 486 (ok, so that's my high end computer)
so I could leave the APE cable plugged into a serial port. If I set
APE to 'Stupid' I don't have to boot to DOS, it will work in a DOS
from Windows. I set Stupid because when APE tries to up the speed,
it crashes Win98SE.
What was I talking about?
Sorry.

Because, as I said, most of those disks are nearly two decades old.
That's a long time for a fairly delicate storage media like the 5.25"
floppy to survive. I've spent a bunch of time trying to copy my old
5.25"ers to my PC, and many (most? quite possibly) of them had bad
sectors here and there - even if they did eventually read OK, it took a
few re-reads to get it. Anything that you have your only copy of on a
5.25" is in danger of being lost, it's that simple.

Anyways, it's easy enough find an old 486 laptop and put a pretty huge
collection of software on it, and run APE, and you'll never have to
worry about a 5.25" going bad ever again, nor will you have to worry
about boxes full of disks that are probably poorly labeled, half of them
are bad, your multiboots are probably full of duplicates, etc, etc...
and, you can store your 1050 in the closet and only worry about your
8bit and a laptop. You can use an old desktop PC but then you need an
external monitor... a tired old laptop is ideal. I use a Dell 233mHz
with a slightly screwy screen (no surprise - Latitude CPs are probably
the worst laptops ever), it's overkill. Regardless, a dedicated PC of
some sort allows you to have it always ready to run APE, and you leave
it permanently connected to your 8bit.

I'm sure there's no way to find out for sure which more people use, but
it seems to me that using a PC as a virtual drive is far faster, more
reliable, and far easier than screwing around with real floppies... and
I'm pretty sure that I'm not the only one who feels that way.

All,

The JYBOLAC:TNG BBS (Just Your Basic On Line Atari Computer :
The Next Generation) is now open! Well, okay, so it has been online for
several months now, but.....

Anyway, telnet on over to
telnet://jybolac.homelinux.com:800 and log into my XEGS running
Carina II via APE.

There is not much there at the moment, but I am adding features all
the time.

Let me know if you have any questions or problems,
Chris (aka - Cybernoid)

I have to agree with Bob on this one. I'm totally all for a dedicated PC running APE, but when I want to use my 1025 printer I have troubles. If the printers on I get error after error when using the SIO2PC cable. It's a simple fix, don't use both at the same time. If I want to print a disk file I transfer it from APE to disk and then power up the printer. I've got quite a few 20+ year old disks that still work great, but I don't trust them so I've made .ATR's out of my favorites.
Really rambling...

I have a bunch of Atari computer stuff including an 800 and a 1200xl. Disk drive, Atari printers, everything with Atari power supplies (I've seen them alone on Ebay). IMO Ebay is not terribly feasible owing to the shipping cost (this stuff has significant weight), so I'm looking for a South Florida Atari club. Anyone have any thoughts on the true value of these items?

Ship that stuff parcel post with the Postal Service or UPS Ground. It is very feasible. Just charge the correct shipping amounts and list it in your auction.

Last time I trafficked in Atari stuff on an online auction service there was definitely a market for it. It can be up and down though. You should be able to sell the computers and the disk drives with ease. Bundle the software into like groups of three or four (games, apps, whatever). Shine everything up to the best of your ability and upload a picture.

You won't make big money but you should do okay.

There's definitely a market. In the last week I've purchased a 400, a
600XL, an 800XL and a 130XE, a 1050 drive and a 410 Program Recorder, all
off ebay. Sellers quote a price, then request an email with your shipping
address. Typically, the next day they tell you their actual shipping costs
to your destination and you just add that to the price.

And as it happens, I am in the market, currently, for an 800 and a 1200XL,
both! :-) Send me an email (address is spam-trapped but you can figure it
out) with your price and we can negotiate if you're interested . . .

Hi everybody,
I sucsefully build the MyIDE interface. I still get a big kick out of seeing it work. I used a 2 color LED in place of the stock power indicator on my 800XL which changes color on disk activity...ANYWAYS...I wanted to use a laptop harddisk to build it into the case, but they don't work. I tried 2 diffrent models. They partition and test fine, but when i go to format they lock up. My Point-Has anyone used a laptod hardrive on this interface sucsesfully?? and if so what model did you use??? I tried IBM 344MB and a Quantum 250MB

Thanks
Ralph

Awesome. Talk about your flashbacks! I think the last time I was on
an Atari BBS was 1989. My 1050 bit the dust, and I was computerless
for several years. Next machine after my 130XE was an AMD 486DX4-100.
Been progressing ever since, but I still use my Atari. I got a
working 1050 a while back, and have been planning on building a cable
to hook up to the PC, but haven't gotten around to doing so yet.

> Over the years, I have had several SuperCarts (SC) that just stopped functioning. This cart worked fine a couple of weeks ago.
Cleaning the "usual suspects" of dirt/oxide on the cart edge connector and eprom contacts makes no difference. <

Got it fixed! I didn't go far enough with the cleaning. Got out the strong work light and magnifying glass, and found lots of crud down in the (cheap) socket. Went after it with contact cleaner and a very small (jeweler's) screwdriver and got it reasonably crud-free. Popped the eprom back in and it came right up. I sure would like to replace that socket with a machined-pin, gold plated socket, but for now, "if it ain't broke... "

Hi there !

Here is a tool I made to help in atari xl tape recovery and

make it E A S Y !

Here are the tools I used you make my BASIC stuff work on my pc

- Save atari prog as ASCII (LIST "C:)

- Record it in a wav file on the pc

- Use WAV2CAS to generate a CAS file

- Use CAS2BAS to generate a BAS file

- Import the BAS file into a disk image with ATRUTIL

- Load the atari prog with XFORMER , using ENTER "Dn:...."

I included the source also , if anyone wants to continue it

http://perso.wanadoo.fr/olivier.lebihan/tool/

Enjoy !

3142. copying ATR images to floppies

Newsgroup: comp.sys.atari.8bit
Date: 2002-06-21 05:24:24 UTC
From: Steve Chamberlin <foo@bar.com>
Message-ID: <cMyQ8.3312$yA3.134486057@newssvr13.news.prodigy.com>
Source record: 29063

Hello everyone,

I'm trying to copy an ATR image of the game MULE to a regular 5.25 inch floppy disk. Using an sio2pc cable, the only way I can see to do this is to run some kind of disk copying program on the Atari itself. The regular DOS duplicate disk command doesn't work, however (it complains that drive types are incompatible).

Using a 3rd-party disk copy program, I was able to successfully copy the MULE image to the floppy (or so I thought), but the game doesn't run correctly. I'm able to boot the game on my 130XE and setup the options, but whenever I try to actually launch the game, it just returns to the main menu. When I play the ATR image using an Atari emulator program instead, it works just fine.

Is this because the ATR image is copy protected in some way? Is there any easy way around this? Ironically, I work for Electronic Arts (publishers of MULE), but I can't exactly go pick up a copy at the company store-- I think they stopped stocking 8-bit software a while ago. :-)

Use Sector copy, destination must be in single density, format disk first to single.

After Your options program try to load a second part of game from disk.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

If you want to use a null modem cable, all you need is a serial port on the atari and pc. You don't need the atari modem. if you don't have a serial port on your atari and you want to use the modem, you'll need a modem on the pc and phone line between the two.

I suggest an SIO2PC cable and Ape software.

If you want to use the modem you'll need either two seperate phone lines or use a telephone line simulator like the Skutch AS-26 to connect the modems. Also, the PC's modem must be set to the same speed as the ataris probably 300baud, 8bit,no parity. You'll also need terminal software on both computers, I think Hyperterm would work on the PC. Really this is just a fancy way to do a null-modem, a cable would do the same thing and be much simpler for the newbie.

Message-ID: <3d1347e5$0$1425$272ea4a1@news.execpc.com>
Source record: 29071

You say DOS dup disk says drive types are incompatible.
Perhaps you are trying to copy a sngle dens .atr to a enhanced
or dble dens disk? Format the disk single, then use the sector
copy, I'm not sure if dup disk is sector copy, I think it is on
DOS 2/2.5 or MyDOS. It shouldn't be copy protection as
it is an .atr.
Someone says you select options, then it loads a second part.
I suspect your 3rd party copier didn't do something correctly.
Slow APE or SIO2PC down to 'Stupid' or the slowest rate, it
may be making errors during the sector copy. SmartDOS has
a sector copy, or Disk Wizard II is a good sector copier, or
SpartaDOS scopy is fair (it just quits if it encounters some error,
Disk Wizard will try again if it encounters a problem.) Your
floppy should be a dbl density floppy, don't try to use a high
density 5.25", generally the dbl/sngl dens has a hub ring, the
high dens doesn't.
Atari 8-bit drives will not work with high dens 5.25" disks.

Well I just got done prying off all of the keys on my 800XL. It was terrible, to type you had to press each key hard and straight down with quite a rough resistance. I

I put the keys in a soapy warm water solution and am going to clean them with a soft towel and let them air dry. Took the keyboard board outside and blew it out with a can of air. Still the key switches feel rough. If you've taken one apart before you know what I am talking about its plastic on plastic.
Anyone have a good solution for the plastic lubricating? I was thinking lithium grease...

thanks!

Hi All,
Is there any site on the net about Page 6?.
I got my hands on 100 Page 6 disks and was thinking about putting them on the net!.
The disk numbers are from 2 to 201.
Does anybody know how many disks did Page 6 do??(up to what number).
If i do put them on the net i will need the numbers that i am missing.

Thanks for your time.

Regards Atari Nut.

Yes, page6.org is in development .... with the permission of Les Ellingham, the original publisher and copyright holder. I will shortly be moving the site to a professional host although it will be a while before all the issues are on-line.
The intention is to include all the issue disks and PD library disks in due course.
Have you already converted the disks you have them to .ATR format? If so it would be enormously helpful if you could help me speed up this part of the site. Email me privately if poss.
Thanks,
Paul Rixon

Back in the late 1970's I got interested in getting a home computer. I had several over the years but finally settled in with the Atari 8 bit. Over the years I got rid of all my other computers but I just couldn't part with my various Atari's. I still crank them up once in awhile and they all work (800 XL, 800 XL with memory upgrade (256K), 130 XE, 1050 Disk Drive with US Doubler (2), 1050 Disk Drive with Happy Enhancement (2), ICD PR: Connection (2), and a bunch of Trackballs and joysticks (some still in the box). I also have over 1,000 orignial program disks and true double density backup disks with most every piece of software that was ever made for the Atari. I also have most of the old Antic and Analog magazines and documentation for all my software. I am sure I have other stuff about which I have forgotten. I never really use this stuff anymore, so I decided I would sell it. I started to look around on the Internet for "Atari Enthusiasts" that might be interested in buying my gear. However, as began to read several Atari message boards, all the old Atari feelings came back! Zork and all the other adventure games (I have them all) and Montezuma's Revenge, Atari Writer & Atari Writer +, PaperClip (with the key) and PaperClip, MS Atari DOS (and all the other various DOS versions), Lotus 123, SynCalc, all the great BBS and Terminal programs, and all of the many, many utilities that came out for the Atari. Those were the days! So now I have decided to keep it all. Lord only knows what I will do with it but I'm keeping it just the same.

Not lithium grease. It is sticky and dries hard.
How about a silicon spray? It leaves little residue.

Source record: 29082

Hello All,

It's been a long long time since I wrote anything on this newsgroup, but I'm still here and still supporting the Atari 8-bit as and when anybody asks me to at http://www.dgs.clara.net

It has always been a problem supplying software outside of the UK because I've never had any way of accepting payments by credit cards, and the software has generally been expensive when converted into US$. I have been looking at what I have licences to sell, and ways of reducing the prices. It is my intention to reduce the costs of the commercial software products down to more sensible prices by ditching the printed manuals and supplying them by e-mail as PDF files. In addition to this I will also make the products available on Amazon zShops so that you can pay by credit cards. I need to know if there are enough people still out there and wanting to buy such things as the QUICK programming language and the SAM desktop system for around $7.50 (5 UK pounds) who would want to buy via zShops by credit card. If you would be interested, please e-mail me: dgs@clara.net

Well, actually, without further "tricks" there are only 16 available
colors available at the same time on the Atari screen. If you're going to
use 128, why not 256? The code is very similar.

But there's a program called ColorView that cleverly manages to display
4096 colors, by using three separate 16-shade screens (one for R, one for
G and one for B) and flipping/interlacing them very quickly. There's
some flickering, but the results are good overall. You can also have a
higher resolution by using three 4-shade screens for a total of 64 colors.
Having separate screens for R, G and B makes it far easier for your
purposes.

Otherwise, let me look among my papers for my drafts and calculations trying
to find an equivalent between RBG and the standard Atari palette of 256 colors.

I have converted such images before, but not to the 8-bit so I am not
sure if a calculation can be used to compute the correct color on the
8-bit or not. However, I have used fixed lookup tables on RGB values.
It's quite easy. Just take the hex value of the red, green, and blue
component in that order and generate a larger hex value. Example:
r=1, g=2, b=3 would be $123, then use this as an index into an array
of replacement colors. You will have to sit down and come up with a nice
fixed palette, and it might end up using more ram than a calculation.
It's an idea anyway. ;-)
